15. Supplementary Notes Project performed in cooperation with the Texas Department of Transportation and the Federal Highway Administration. Project Title: Evaluation of Horizontal Signing Applications URL: http://tti.tamu.edu/documents/0-4471-3.pdf					
16. Abstract The results of two-year durability tests of preformed thermoplastic pavement marking materials are reported. A survey of material manufacturers is also presented. Pavement marking materials in the form of transverse lines, arrowheads, and sections of the letter S were installed at test decks on three Texas roadways. Small square sections of colored pavement marking materials were also tested for some of the manufacturers. Manufacturers' representatives performed the installations. Three types of pavement surface were tested: concrete, asphalt, and seal coat. Retroreflectivity and color measurements of the materials were made at the time of installation, after one year, and after two years. Thickness of the material was measured prior to installation and at the same time intervals using video microscopy of samples chiseled from the roadway.					
17. Key Words Horizontal Signing, Pavement Marking Symbols, Pavement Marking Materials, Durability Testing			18. Distribution Statement No restrictions. This document is available to the public through NTIS: National Technical Information Service Springfield, Virginia 22161 http://www.ntis.gov

DISCLAIMER

The contents of this report reflect the views of the authors, who are responsible for the facts and the accuracy of the data presented herein. The contents do not necessarily reflect the official view or policies of the Federal Highway Administration (FHWA) or the Texas Department of Transportation (TxDOT). This report does not constitute a standard, specification, or regulation. The researcher in charge of this project was Dr. Susan Chrysler. The engineer in charge of this project was Steven D. Schrock, P.E., Texas License #92982.

The materials included in this evaluation include several trademarked products, these are:

- Flametape™ registered trademark of Ennis Paint, Inc.
- PREMARK™ registered trademark of Flint Trading, Inc.
- HotTape™ registered trademark of Avery Dennison Corporation
- ThermaLine™ registered trademark of LaFarge, Inc. This product line was sold to Ennis Paint, Inc. in June 2003.
- Rocbinda™ registered trademark of Jobling Purser, Ltd.
- DigiMark™ registered trademark of Digital Markings, Ltd.
- StreetPrint™ registered trademark of Integrated Paving Concepts, Inc.

The United States Government and the State of Texas do not endorse products or manufacturers. Trade or manufactures' names appear herein solely because they are considered essential to the object of this report.

ACKNOWLEDGMENTS

This project was conducted in cooperation with TxDOT and FHWA. The authors would like to acknowledge the support of Roy Wright of the Abilene District, who served as project director, Sally Wegman of the Houston District, who served as program coordinator, Greg Brinkmeyer of the Traffic Operations Division, who served as project advisor, and Wade Odell, the RTI Research Engineer. Jerry Howell and Herb Smart of the Construction Division also provided invaluable assistance with the durability testing. Dock Gee and Mike Manor of the Houston and Abilene Districts provided logistical support with test deck installations in those locations. This project enjoyed the great cooperation of the many pavement marking vendors who all provided their materials and installation technical service free of charge.

CHAPTER 1: PAVEMENT MARKING MATERIAL SELECTION

This report documents the durability testing of pavement marking materials intended for use in horizontal signing applications. A previous report describes tests of driver comprehension of these messages and field tests of the effects of horizontal signing on speed at rural curves and wrong-way movements on two-way frontage roads (*1*).

A major task of the project was to place potential horizontal signing materials on a series of on-road test decks and evaluate their performance over time. Researchers performed two tasks to identify potential horizontal signing materials:

1. Survey product vendors/manufacturers for material recommendations.
2. Review and analyze recent National Transportation Product Evaluation Program (NTPEP) data.

VENDOR SURVEY

Researchers contacted vendors that were believed to possess material(s) suitable for use as horizontal signing. Vendors were asked to participate in a short survey, which was administered either via e-mail or over the phone in fall 2002. [Appendix A](#) includes a copy of the survey questionnaire. The purpose of the survey was to identify vendors that:

- could provide material(s) suitable for use on Portland cement concrete (PCC) or hot-mix asphalt concrete (HMAC) under severe traffic conditions,
- could provide material(s) suitable for use on surface treatments (i.e., seal coat) under low-medium traffic conditions, and
- were willing to provide materials and technical support for placement on a series of on-road test decks.

[Table 1](#) summarizes the survey findings. Detailed responses from each individual vendor can also be found in [Appendix A](#).

Table 1. Vendor Survey Summary.

Name	Contacted?	Survey Response?	Recommended Material
Ennis	Yes	Yes	Preformed Thermoplastic
LaFarge	Yes	Yes	Preformed Thermoplastic
Avery Dennison	Yes	Yes	Preformed Thermoplastic
Flint Trading	Yes	Yes	Preformed Thermoplastic
Rocbinda	Yes	No	Colored Aggregate Overlay
3M	Yes	Yes	Tape
ATM	Yes	Yes	Tape
Trelleborg	Yes	Yes	Tape
GRT	Yes	Yes	Tape
Highway Ceramic Products	Yes	No	Nonreflective Ceramic Tile
Swarco	Yes	Yes	Tape
Digital Markings Ltd.	Yes	Yes	Polyurethane Colored Graphic Sheet
BriteLine	Yes	Yes	N/A

NTPEP REPORTS

NTPEP is responsible for testing and evaluating products, materials, and devices that are commonly used by the American Association of State Highway and Transportation Officials (AASHTO) member departments of transportation. NTPEP is a major resource for comprehensive pavement marking evaluations performed at the national level. Although data are furnished in NTPEP reports, no approval, disapproval, or endorsements of products are made per NTPEP/AASHTO policy.

Texas Transportation Institute (TTI) researchers obtained and reviewed the following three recent NTPEP pavement marking reports:

- 2000 Urban California Test Deck (first year data), Report 02 NTPEP 216 (2);
- 2000 Pennsylvania Test Deck (first year data), Report 02 NTPEP 221 (3); and
- 1999 Mississippi Test Deck (second year data), Report 02 NTPEP 220 (4).

All materials included in a given NTPEP evaluation were evaluated on both a PCC roadway and an HMAC roadway. A detailed description of the NTPEP data sources can be found in [Appendix B](#).

TTI research staff analyzed the first-year¹ retroreflectivity and durability data for applicable materials from each of the three NTPEP reports (2,3,4). TTI research staff rated a total of 36 materials produced by six manufacturers, which were limited to preformed thermoplastics and permanent preformed tapes.

Table 2 displays the vendor information for the NTPEP materials that were rated by the researchers.

Table 2. Product Vendor Information for NTPEP Data.

Vendor	Material Type	NTPEP Test Deck
Avery Dennison	Preformed Thermoplastic	2000 Penn, 1999 Miss
BriteLine	Permanent Tape	2000 Penn, 1999 Miss, 2000 Cal
Ennis	Preformed Thermoplastic	1999 Miss, 2000 Cal
Flint Trading	Preformed Thermoplastic	2000 Penn, 1999 Miss, 2000 Cal
LaFarge	Preformed Thermoplastic	2000 Penn, 1999 Miss, 2000 Cal
3M	Permanent Tape	2000 Penn, 2000 Cal

Materials were rated as “good,” “marginal,” or “poor” based on a combination of the retroreflectivity and durability performance in the wheelpath. Wheelpath data were selected for analysis due to the accelerated wear vs. non-wheelpath data. For consistency purposes, ratings applied to only white materials, and PCC and HMA pavement surfaces received separate ratings. The TTI rating criteria are shown in Table 3.

Table 3. Rating Criteria for NTPEP Wheelpath Data.

	Rating Criteria*		
	Pass	Marginal	Fail
Retroreflectivity (mcd/m ² /lx)	>150	70-150	<70
Durability Rating** (0 min, 10 max)	9-10	7-8	≤6

*For materials with different ratings for retroreflectivity and durability, the lesser rating determined the overall rating.

**Durability rating equals the percent of material remaining on the surface divided by 10.

Based on the NTPEP data and the criteria described in Table 3, the researchers generated a list of the top performing potential horizontal signing materials.

¹ Second-year data were analyzed from the Mississippi deck.

Table 4 and Table 5 display all materials receiving “passing” ratings for PCC and HMA surfaces, respectively.

Table 4. Top Performing Materials on PCC Pavements Based on NTPEP Data.

Material	Vendor	Product Number	NTPEP Location	Thickness (mil)	Surface Prep.	Primer/ Sealer	Bead Type

CHAPTER 2: TEST DECK INSTALLATION

The durability of materials that could be used in horizontal signing applications was assessed on three test decks in Texas. Because horizontal signs may include large symbols or text with curved edges, these designs were included in the test. Unlike most longitudinal lines, horizontal signs are placed in the wheel track, which is a more challenging environment for pavement marking materials. The wheel track poses more wear from tire hits and more oil tracking. Tire hits cause pavement markings to fail by wearing through the material and by wearing off the retroreflective elements. Oil tracking causes failures in daytime color and through chemical breakdown of the materials.

The measurements described in this chapter were repeated at one-year intervals for a period of two years.

TEST DECK MATERIALS AND CONFIGURATION

Based on the survey of manufacturers and contacts with TxDOT staff and vendors, researchers developed the final list of vendors and product lines. Not every vendor was able to attend every test deck installation. Additionally, not all vendors installed the same products at each test deck location. The individual deck descriptions in the [next section](#) include notes regarding deviation. Vendors were invited to provide 12 inch square samples of any special colored products that they wanted to include. Many vendors produce special colors for commercial applications such as fast-food drive through lanes and toll plaza lane markings. It was desirable to include these in this project so that future uses of color, such as in interstate route shields, could be expedited by having completed durability assessments. Most vendors supplied two thicknesses of their products for testing, nominally 90 mil and 125 mil. Flint Trading elected to test only the 125 mil thickness because results of its own internal testing do not support the use of a 90 mil product in these applications. Flint did occupy two test spots but repeated the 125 mil product in the second spot. LaFarge elected to test the two product thicknesses in the transverse line application only, expressing the opinion that results would apply to symbols as well. [Table 6](#) summarizes the vendors and the materials tested.

Table 6. Vendor and Materials List.

Vendor	Symbol and Transverse Line Product 1	Symbol and Transverse Line Product 2	Colors Tested
Avery - Dennison	HotTape 125 mil	HotTape 90 mil	Yellow-Green, Blue
Ennis Paint	Flametape 125 mil	Flametape 90 mil, transverse line only	Red, Yellow-Green light, Yellow-Green dark, Blue
Flint Trading	PreMark 125 mil	PreMark 90 mil	Yellow-Green
LaFarge	Thermaline 125 mil	Thermaline 90 mil	Red, Yellow-Green, Blue, Purple
Jobling-Purser	Rocbinda aggregate	N/A	Red
Digital Markings	DigiMark 300 mil	N/A	None

It should be noted that in late June 2003 LaFarge Thermaline was acquired by Ennis Paint. In addition, Zumar Industries Inc. acquired the Hot Tape™ thermoplastic business unit of Avery in 2004. The effect that this acquisition will have on future product offerings and testing is not clear at the time of this report.

A variety of symbol shapes were selected for inclusion in the test deck. Because wear and shear forces differ on transverse, longitudinal, curved, and pointed edges, each of these shapes were included. An arrow head, pointed in the direction of traffic so as not to confuse drivers, represented a pointed edge and the letter S represented a curved edge. To limit the overall longitudinal distance of the entire deck, only half of each symbol was included. Vendors provided the top half of a stock 9 foot lane-use arrow, as shown in Figure 3B-20 of the Manual on Uniform Traffic Control Devices (MUTCD). They also provided the top half of an 8 foot letter S, which is a stock item for school crossing markings. A 12 inch wide transverse line 10 feet in length was placed across the lane of travel. The 12 inch square color patches were placed outside of the wheel track toward the roadway edge. Standard yellow markings were not included in the test because their applications are limited to longitudinal markings. [Figure 1](#) shows the layout and dimensions of the test area.

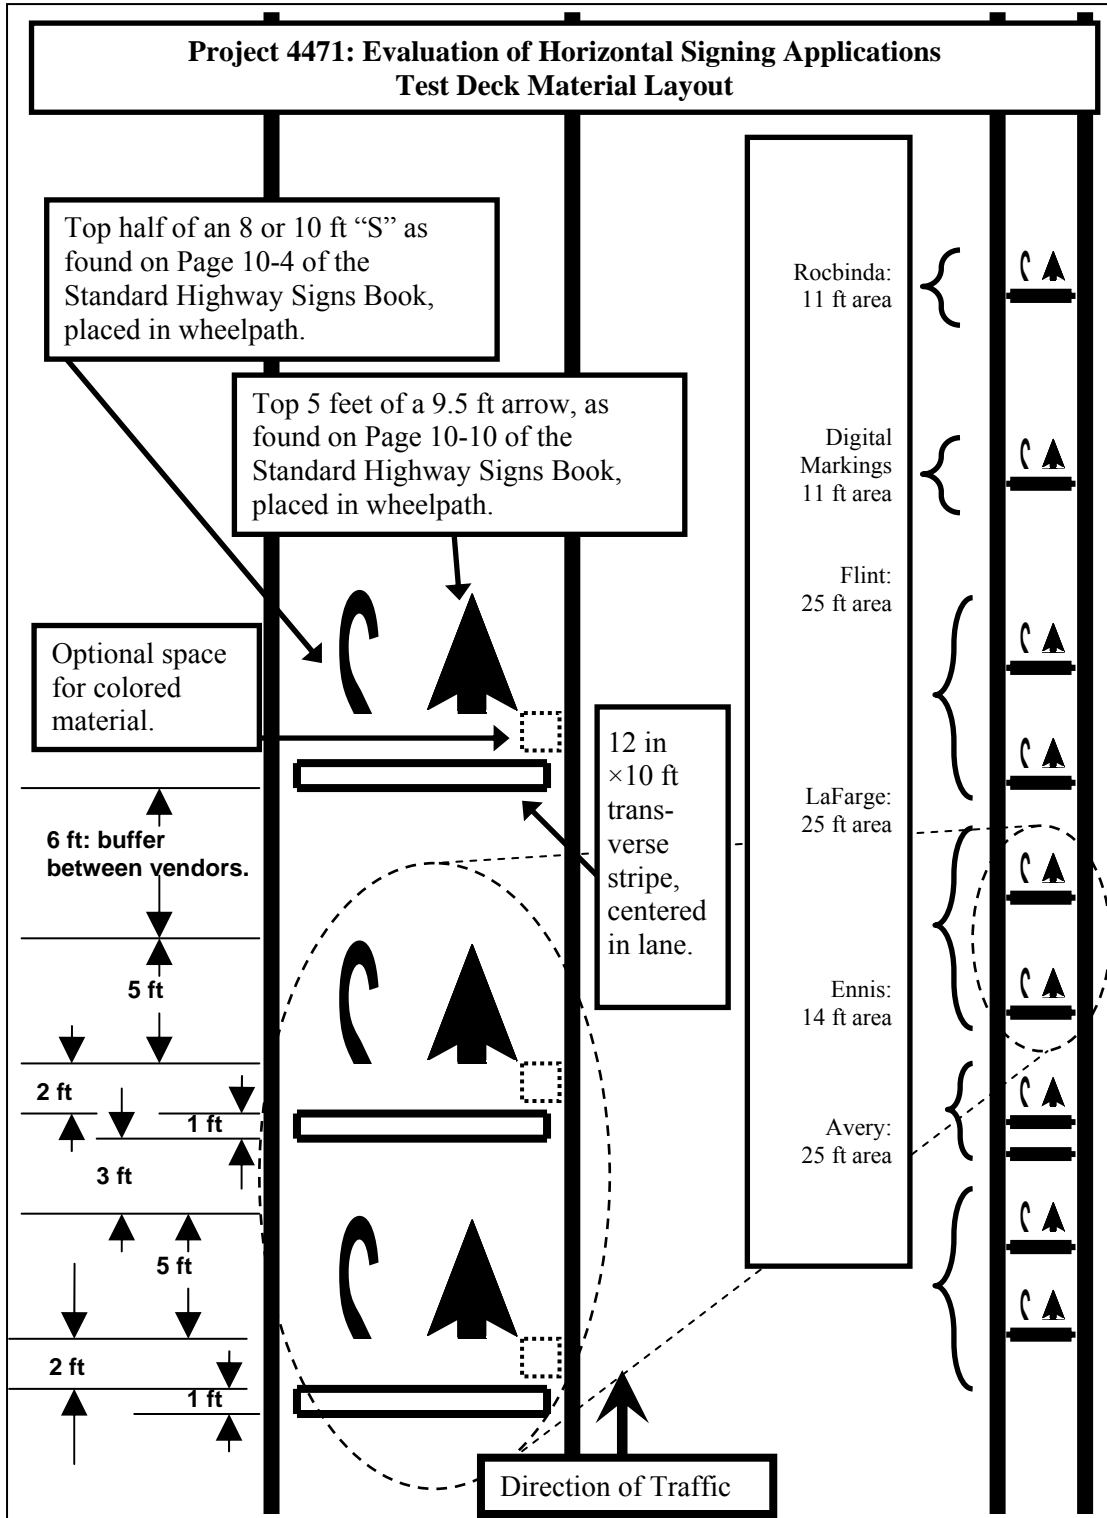

Figure 1. Test Deck Layout.

TEST INSTRUMENTS AND PROCEDURE

American Society for Testing and Materials (ASTM) test method D713-90 (5) was followed as appropriate for testing the durability of preformed thermoplastic materials. Because this test method does not address materials such as Rocbinda™, adaptations were made where appropriate. A sign placed upstream of the test areas informed drivers of the upcoming pavement markings.

Before any materials were installed, TxDOT Construction Division staff measured and marked each vendor's test area (Figure 2).

Figure 2. TxDOT Staff Measuring Test Areas.

After each work area was defined, the manufacturer's representatives each measured and laid out the materials according to the diagram shown in Figure 1. These measurements are typical installation procedures for preformed symbols. A typical layout procedure is illustrated in Figure 3, which shows the Avery-Dennison representatives aligning transverse line pieces.

Figure 3. Layout of Preformed Sections before Application.

Material Thickness

Material thickness was measured with a caliper on the material before it was laid. Subsequent measurements were made by removing a section of the material and measuring the thickness using an electronic video microscope. [Figure 4](#) shows the caliper measurement instrument. The caliper was moved across the materials, avoiding beads and nonskid particles, to estimate the average thickness of the thermoplastic layer of the material. Note that these measurements can only be made within an inch of the edge of the material because of the caliper size. Some compression of material could have occurred during the slitting process in manufacturing. In addition, most manufacturers' thickness specifications call for measurements from the top of the beads, whereas our measurements avoided beads for consistency.

Figure 4. Thickness Measurements on a Piece of Red Preformed Thermoplastic.

Size of Marking

The actual area of the installed material was measured, accurate to the quarter-inch, after the material was completely installed. Subsequent measurements of the quantity of material remaining allowed an assessment of road presence. While size measurements were being made, bead embedment was inspected on materials that showed obvious scorching. [Figure 5](#) shows this procedure on installed material.

Figure 5. Bead Embedment Inspection Using a Jeweler's Loupe.

Retroreflectivity

The coefficient of retroreflected luminance (R_L) was measured using a MiroLux MX30 retroreflectometer. This instrument uses 30 m geometry and provides values in units of millicandelas per square-meter per lux ($\text{mcd}/\text{m}^2/\text{lx}$). Retroreflected luminance is a measurement of how much vehicle headlight can be returned to the driver's eye by the reflective elements in the pavement markings. For the white markings, both symbols and transverse lines, measurements were made at two to four different spots on each marking. For the colored squares, only one measurement was made due to the small size of the patch. [Figure 6](#) shows staff performing luminance measurements.

Figure 6. Retroreflectivity Measurements.

Color Measurements

Daytime color was measured using a BYK-Gardner colorimeter (see [Figure 7](#)). This instrument measures hue, or chromaticity, which plots on an x,y chart of color space. Whiteness, or cap-Y, is also measured. Values of cap-Y range from 0 to 100, with 0 being perfect black and 100 being perfect white. Color shift, a standard quality assurance check, can be determined over time by looking at how these three values change. Fading of the colored sections is revealed by a change in the x,y position and/or a likely increase in the cap-Y as the pigments bleach. White material generally darkens over time due to dirt accumulation, resulting in lower cap-Y values. Tracking and oil drips also produce lower cap-Y values. Pigment bleaching in the yellow, as

well as other colors, may be overcome by dirt and oil accumulation to produce lower cap-Y values as well.

Figure 7. Color Measurement Instrument.

TEST DECK LOCATIONS

[Appendix C](#) lists the exact materials tested at each of the test deck locations. [Appendix D](#) contains photographs of each of the test decks including details of installation and inspection. The dates of installation and inspection are shown in [Table 7](#). The [following section](#) provides an overview of the material installations.

Table 7. Installation and Inspection Dates for Test Decks.

	Abilene	Austin	Houston
Installation Date	9/18/2003	6/3/2003	7/29/2003
Year 1 Inspection	11/15/2004	6/6/2004	11/11/2004
Year 2 Inspection	10/3/2005	7/7/2005	8/3/2005

Asphalt Pavement: Austin

A test area was installed on U.S. Highway 183 northbound, just south of State Highway (SH) 71 in the Austin area on June 3, 2003. This test deck is an extension of an already existing TxDOT Construction Division testing area. The pavement is worn asphalt. The annual average daily Traffic (AADT) for this road is 6500 vehicles per lane per day. An overview of the completed test area is shown in [Figure 8](#).

Concrete Pavement: Houston

A test area was installed on Interstate 10 westbound, between Mercury and East Loop 610 in July 2003. The pavement in this area is worn concrete. The AADT for this road is 33,600 vehicles per lane per day.

Chip-Seal Pavement: Abilene

A test area was installed in August 2003 on SH 351 in the Abilene District. The pavement was newly laid Grade 3 seal coat. The AADT for this road is 1875 vehicles per lane per day.

Figure 8. Austin Test Deck.

Most materials were installed using traditional flame application methods as shown in [Figure 9](#), which shows representatives from Avery-Dennison using a propane torch to preheat the pavement. The different vendors used slightly different surface preparation techniques and torch types. [Figure 10](#) shows two different types of propane torches being used to melt the preformed thermoplastic. Flint Trading is shown on the left, and Ennis Paint is shown on the right.

Figure 9. Preheating the Pavement with a Propane Torch.

Figure 10. Two Different Types of Propane Torches Used.

Two unusual application methods were used at the Austin installation. LaFarge was unable to provide their usual technical service support and instead used a crew from Integrated Pavement Concepts, Inc. This Canadian company specializes in pavement texturizing to simulate decorative brick. Their equipment heats up new or existing asphalt and then embosses a decorative pattern into the pavement. This same equipment can be used to preheat and melt preformed thermoplastic symbols. [Figure 11](#) shows the equipment, called Streetprint™. The heating element is the large bar near the engine. This heating element travels back and forth along the horizontal rods extending to the right in the photograph. The marked application area

for the LaFarge products is shown in [Figure 12](#) as the machine prepared to preheat the pavement. [Figure 13](#) shows the machine melting a transverse line. The device in the hand in view in the left of the photograph is an infrared thermometer used by all the installers to check the temperature of the pavement and materials during the installation process.

Figure 11. The Streetprint Machine.

Figure 12. The Streetprint Machine Preheating the Application Area.

Figure 13. The Streetprint Melting a Transverse Line.

The other unusual product and process was the Rocbinda colored road surfacing product from Jobling-Purser, Ltd. of England. This material is a polyurethane resin binder holding an aggregate stone mixture. The aggregate can be made of naturally or artificially colored rock. The installation procedure for symbols normally uses a premade stencil. For the installation for this project, symbols were marked using masking tape. Because of the difficulty of creating curved shapes by hand with tape, the top half of a letter Z shape was used in place of the letter S for this product.

Application of this segment, with two workers, took more than two hours. Using of a premade stencil could reduce this time somewhat. [Figure 14](#) shows the symbols marked with tape and application of the polyurethane resin binder. The next step, shown in [Figure 15](#), is placement of the aggregate. Note that with hand placement, wide variation in material thickness is possible. Great care was taken by the vendors to completely and uniformly cover the binder. The aggregate must be applied to the binder while it is still wet. Some material overage is expected in order to assure good coverage to the symbol's edge. [Figure 16](#) shows the letter Z section just after the aggregate was spread. After the mixture sets up, the excess is swept off, as shown in [Figure 17](#). The masking tape, or stencil if one is used, is then removed, as shown in [Figure 18](#). In order to provide a contrast edge, a second masking is required after the main

symbol has completely set. A second batch of binder and darker aggregate is applied and, after it has cured, the masking tape is removed to produce an edged symbol as shown in [Figure 19](#). In addition to the symbols, Rocbinda also provided a red-colored patch. The Rocbinda test segment was placed last in the lane of travel to prevent any loose aggregate from contaminating other products. The completed segment is shown in [Figure 20](#).

Another unusual material tested was the DigiMark material, included in Abilene and Houston. Delivery of the material was delayed, and it was therefore not included in the Austin test installation. [Figure 21](#) shows the DigiMark material newly installed in Abilene. This material is a full digitally printed sheet manufactured by Digital Marking, Inc. It is commonly used for floor advertising in retail stores. The material did not perform well at either test location. The Digital Markings and Rocbinda products do not contain retroreflective elements and are intended for use in areas with high mast lighting.

Figure 20. Completed Robinda Segment.

Figure 21. DigiMark Preformed Sheet.

CHAPTER 3: RESULTS OF DURABILITY TESTING

This chapter presents a summary of the results. As noted earlier, [Appendix C](#) lists the exact materials tested at each of the test deck locations. [Appendix D](#) contains photographs of each of the test decks including detailed photos of damaged or failing materials. In a few instances, measurements were not obtained due to oversight in the field or data recording failures.

Most of the materials maintained road presence throughout the duration of the test. Material presence was documented through photographs and physical measurements. [Appendix C](#) indicates those locations where material failed to adhere to the pavement.

RETROREFLECTIVITY

Retroreflectivity was measured at two to four spots on each sample. The average values are reported for each sample. No standards exist on minimum required retroreflectivity for pavement marking symbols. The minimum value for a longitudinal line of nominal 4 inches width of 150 mcd is desired to assure nighttime visibility (6). It is not clear if this minimum is applicable to a large pavement marking symbol or word. It may be that, due to the size of the symbol, minimum reflectivity values for horizontal signing applications may be lower. There are no widely applied minimum reflectivity values for colored pavement markings, other than standard yellow.

To summarize the results, the retroreflectivity values for the transverse lines are shown for each of the test decks in [Figure 22](#) through [Figure 24](#). Most products showed a sharp drop in retroreflectivity in the first year. A few products increased in reflectivity, which may be attributed to new beads being exposed through wear. On the seal coat test deck in Abilene, many of the materials developed a glossy sheen, presumably due to abrasion from loose aggregate. This abrasion wore down the beads, resulting in lower reflectivity values than at the other test locations. Details of each of the test samples, including the symbols and colored patches, are provided in tables in [Appendix E](#).

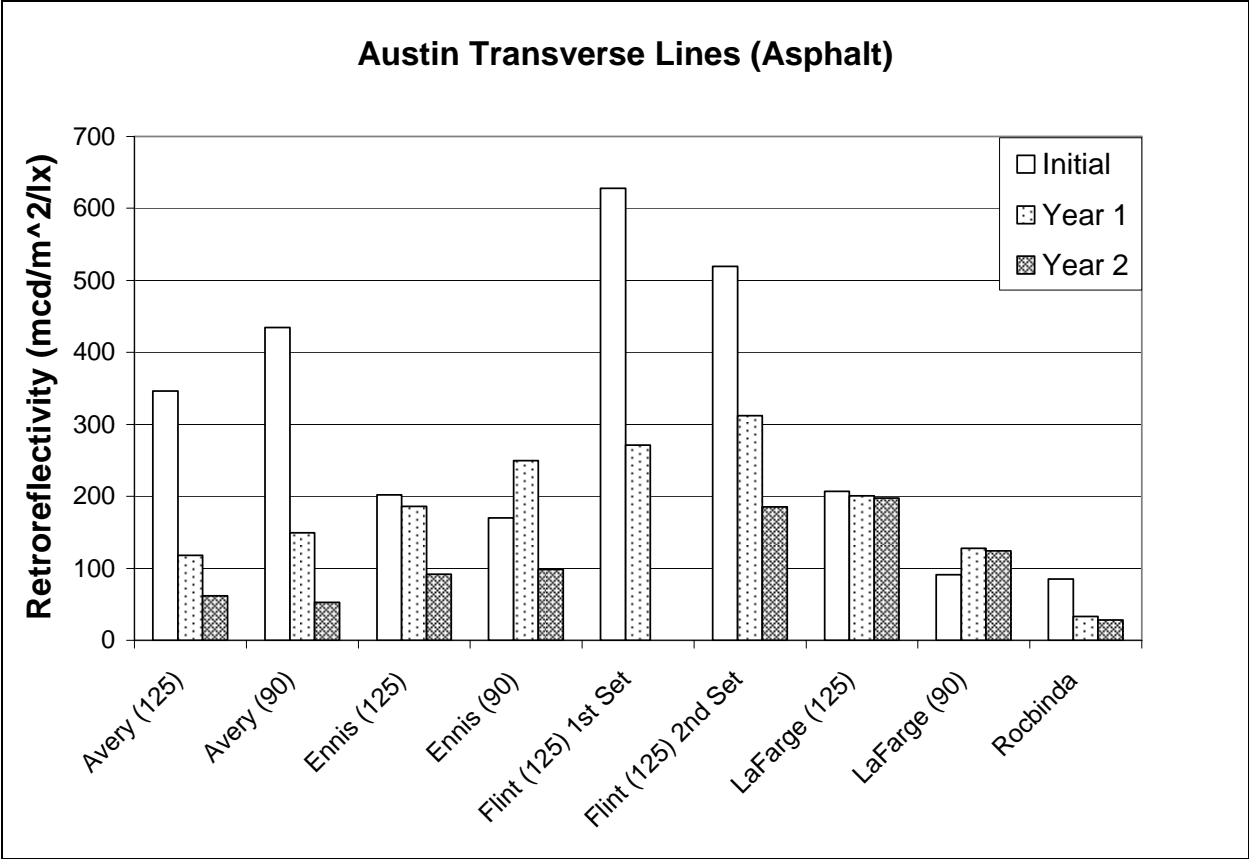

Figure 22. Retroreflectivity Values for White Transverse Lines for Asphalt Test Deck.

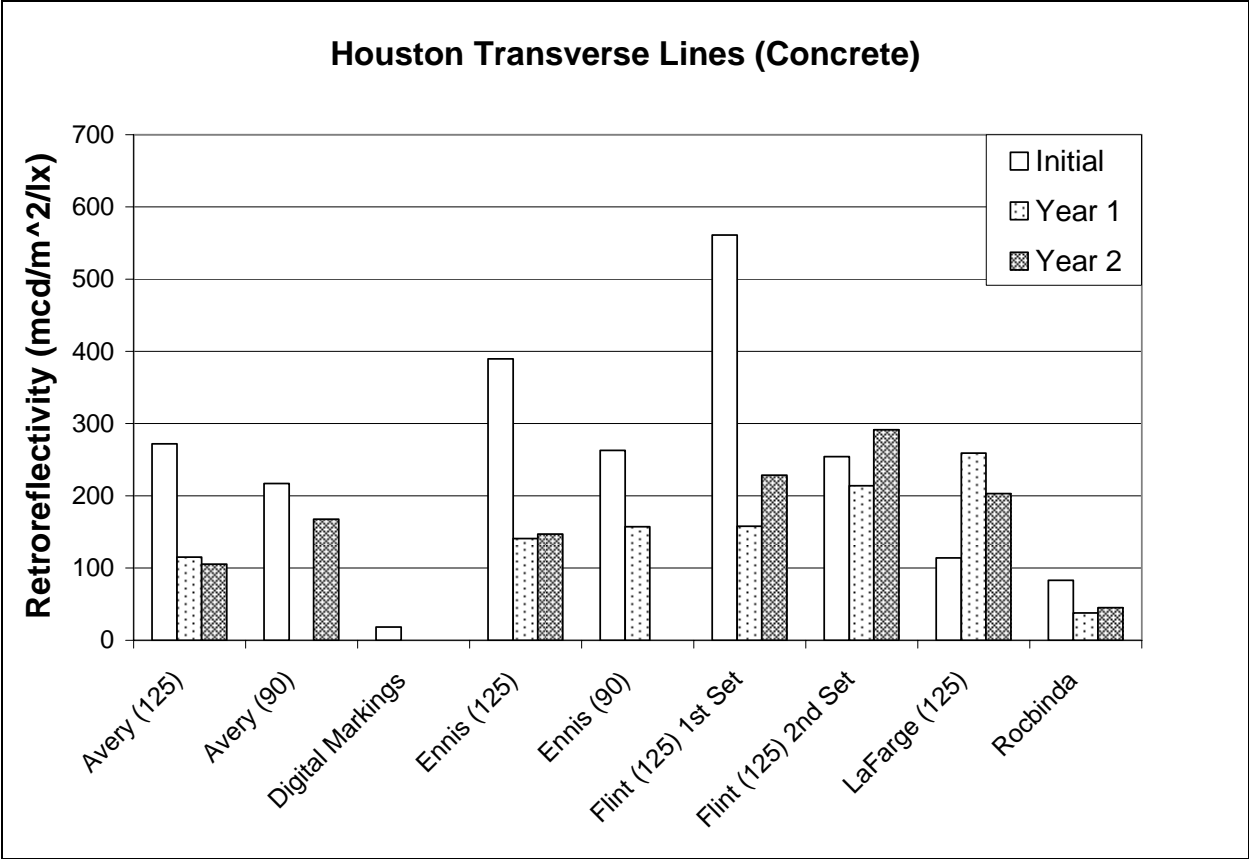

Figure 23. Retroreflectivity Values for White Transverse Lines on Concrete Test Deck.

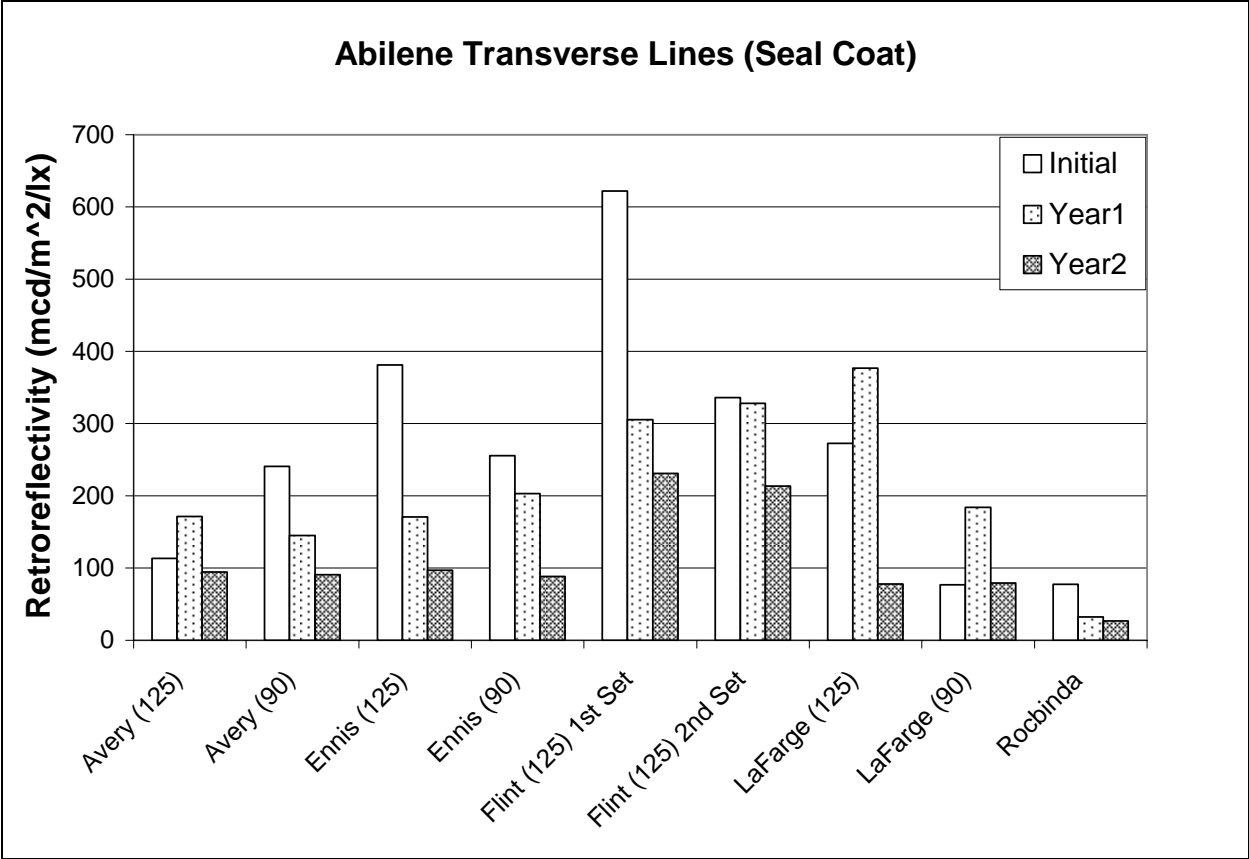

Figure 24. Retroreflectivity Values for White Transverse Lines for Seal Coat Test Deck.

THICKNESS

Thickness measurements for the Abilene seal coat pavement test deck for all measurement periods are presented in [Figure 25](#) through [Figure 27](#). These measurements were made initially using a manual caliper (see [Figure 4](#)). Subsequent measurements were made by chipping a piece of material off and bringing the sample to the TxDOT Construction Division laboratory for measurement on a electronic video microscope. This instrument uses image processing software to provide physical measurements of samples. A thickness measurement was made in several locations across the sample perpendicular to the surface. [Figure 28](#) shows an image with the accompanying perpendicular line and measurement indication.

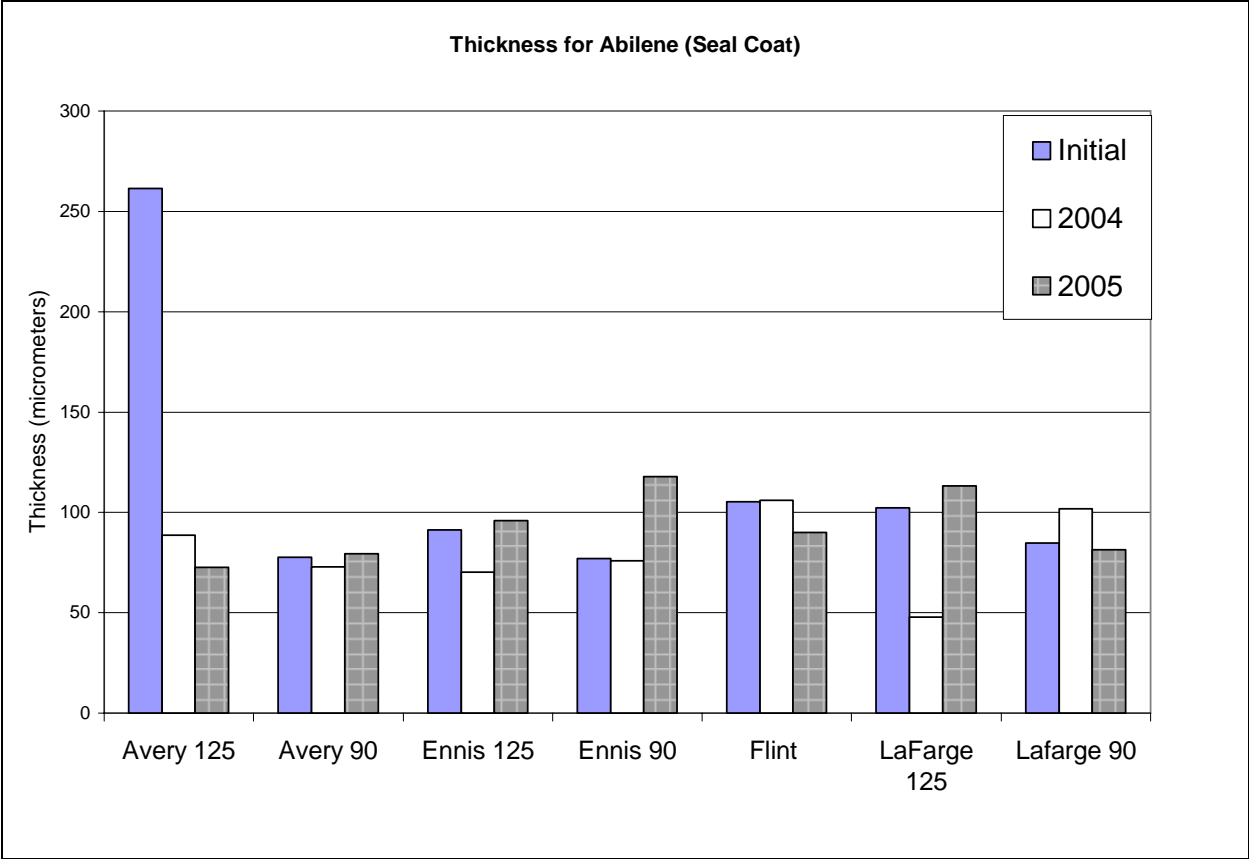

Figure 25. Thickness Data for Abilene Test Deck.

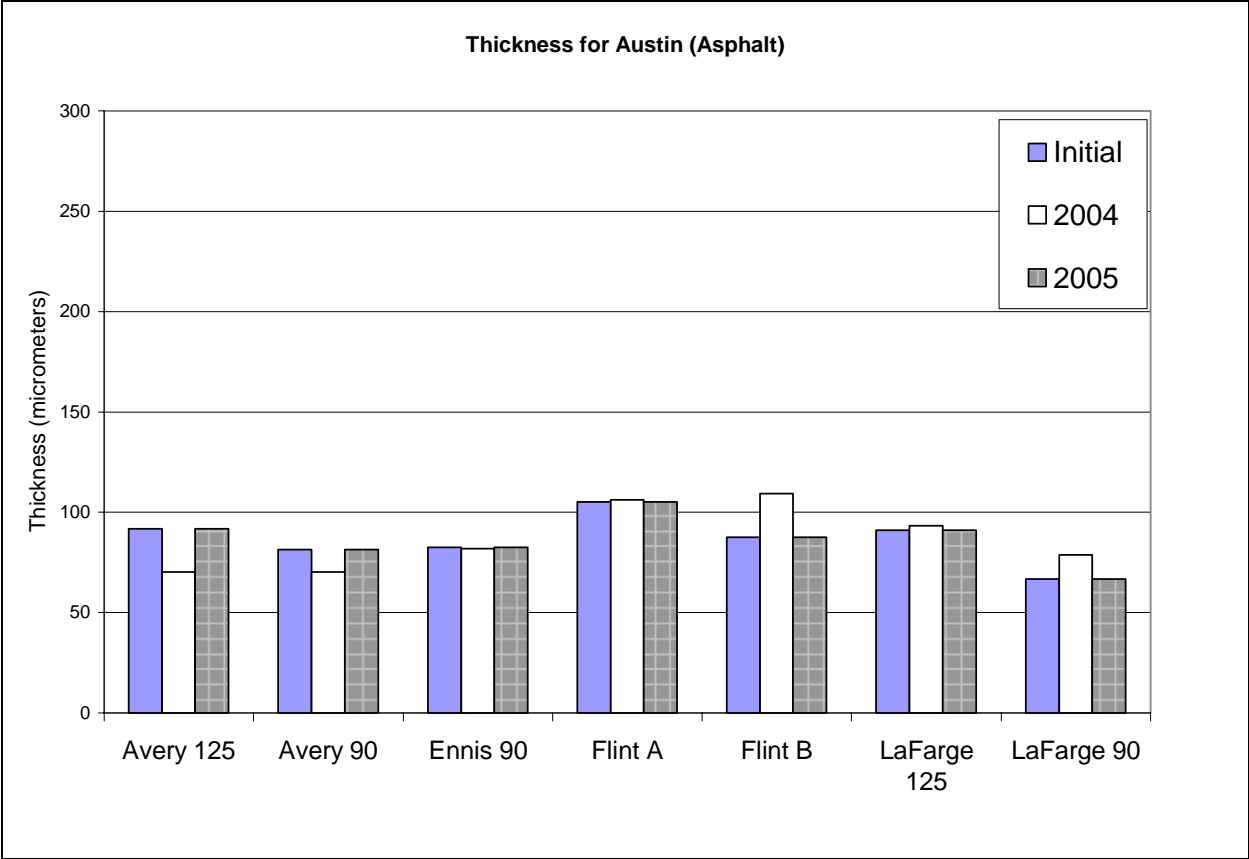

Figure 26. Thickness Data for Asphalt Test Deck.

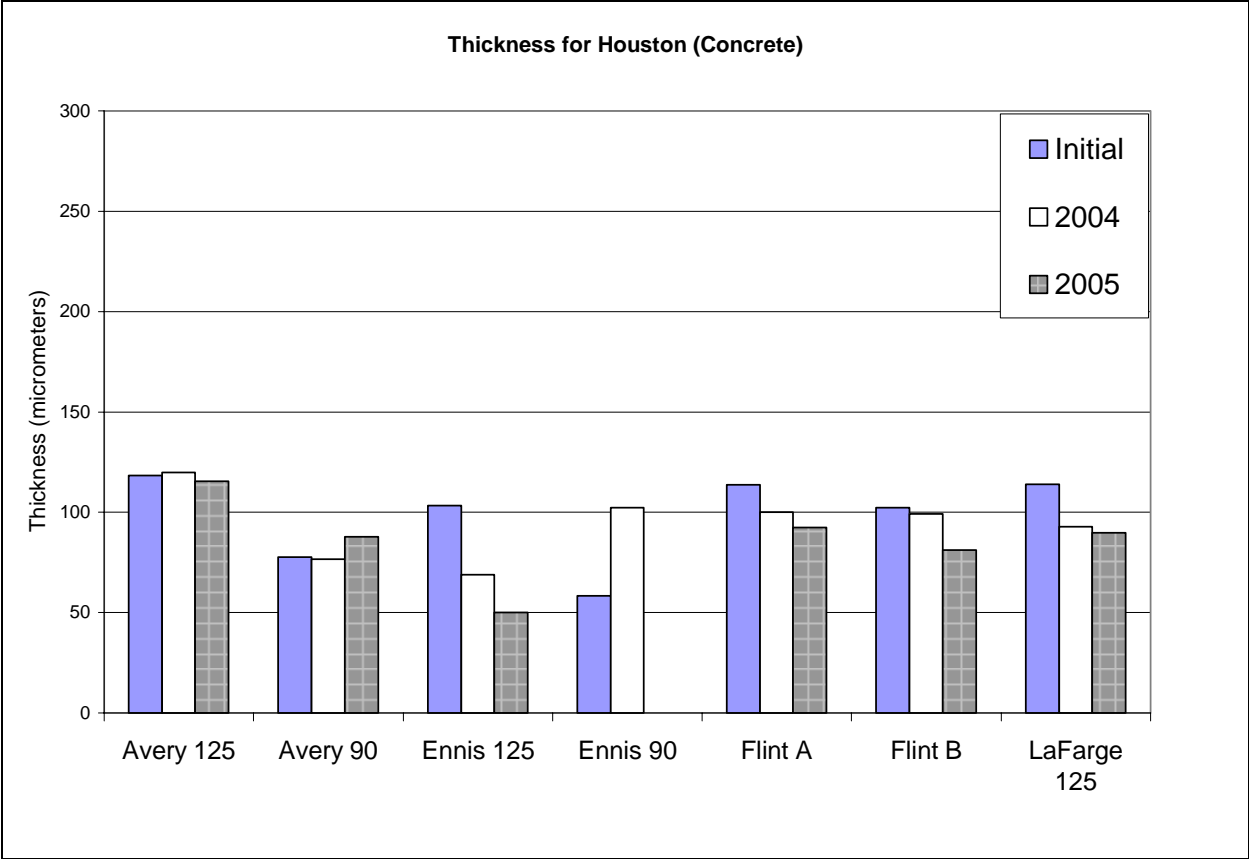

Figure 27. Thickness Data for Concrete Test Deck.

Figure 28. Microscope Image of a Thickness Measurement.

COLOR MEASUREMENTS

Daytime and nighttime color requirements for pavement markings are specified in an amendment to the Code of Federal Regulations published in 2002 (7). The colorimeter instrument used in this project measured daytime color only. Color is specified in three-dimensional color space with x,y coordinates denoting the hue and Y (“cap-Y”) denoting the saturation, where a cap-Y value of 100 is perfect white, and a value of 0 is perfect black. White pavement markings must have a minimum cap-Y value of 35. There are color coordinates provided in the 2002 document for white and yellow pavement markings. These coordinates are similar to the color coordinates for retroreflective sign sheeting material, but are not identical. Color specification boxes are shown in Figure 29 for the four pavement marking colors specified by FHWA. The boxes for daytime color of retroreflective sign sheeting for yellow-green and

purple are provided for reference. The third dimension, not shown on this chromaticity chart, is the cap-Y value. These data will be presented later in separate charts.

Chromaticity values for all the white markings are shown in [Figure 30](#). This close-up of the white region of color space illustrates that all of the white markings, except one sample from the asphalt test deck, remained in the white box throughout the two years of the test. Individual results for each product at each test location are presented in [Appendix F](#).

The results for the red markings are shown in [Figure 31](#) as a close-up of the red region of color space. Note that the majority of the markings are not in the color box at the end of the two-year test period. The Rocbinda red markings were not in the red box initially. The direction of movement is toward the center, or white region, of color space, indicating that the markings are beginning to bleach. To the naked eye, the markings still appeared red at the two-year inspection time.

The same data for the blue markings are shown in [Figure 32](#). Two of the products were not in the color box at the time of the installation. All of the products were outside of the box at the Year 1 inspection and continued to move toward the white region through the second year.

The data for yellow-green and purple markings are not shown in graphical form because FHWA has not provided color boxes for these special colors. The data are presented, along with the details on all the markings, in [Appendix F](#). Like the red markings, the direction of color shift for the blue markings faded toward white during the test period.

**Color Boxes for
Pavement Markings (daytime)
(C.I.E. 1931 Chromaticity Diagram)**

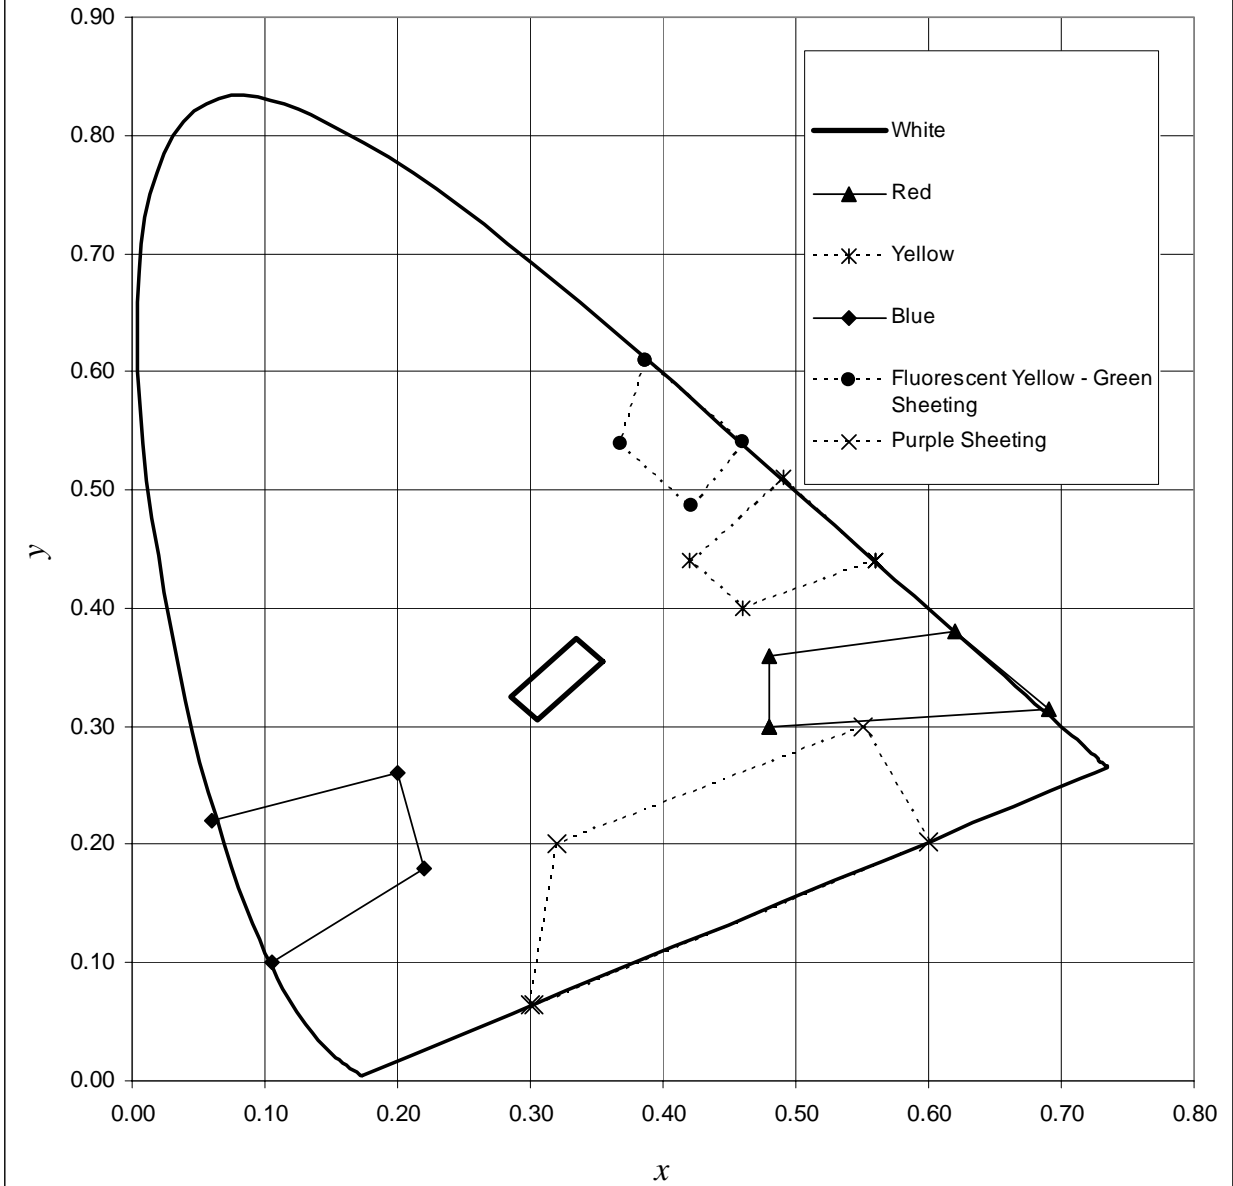

Figure 29. Daytime Color Boxes.

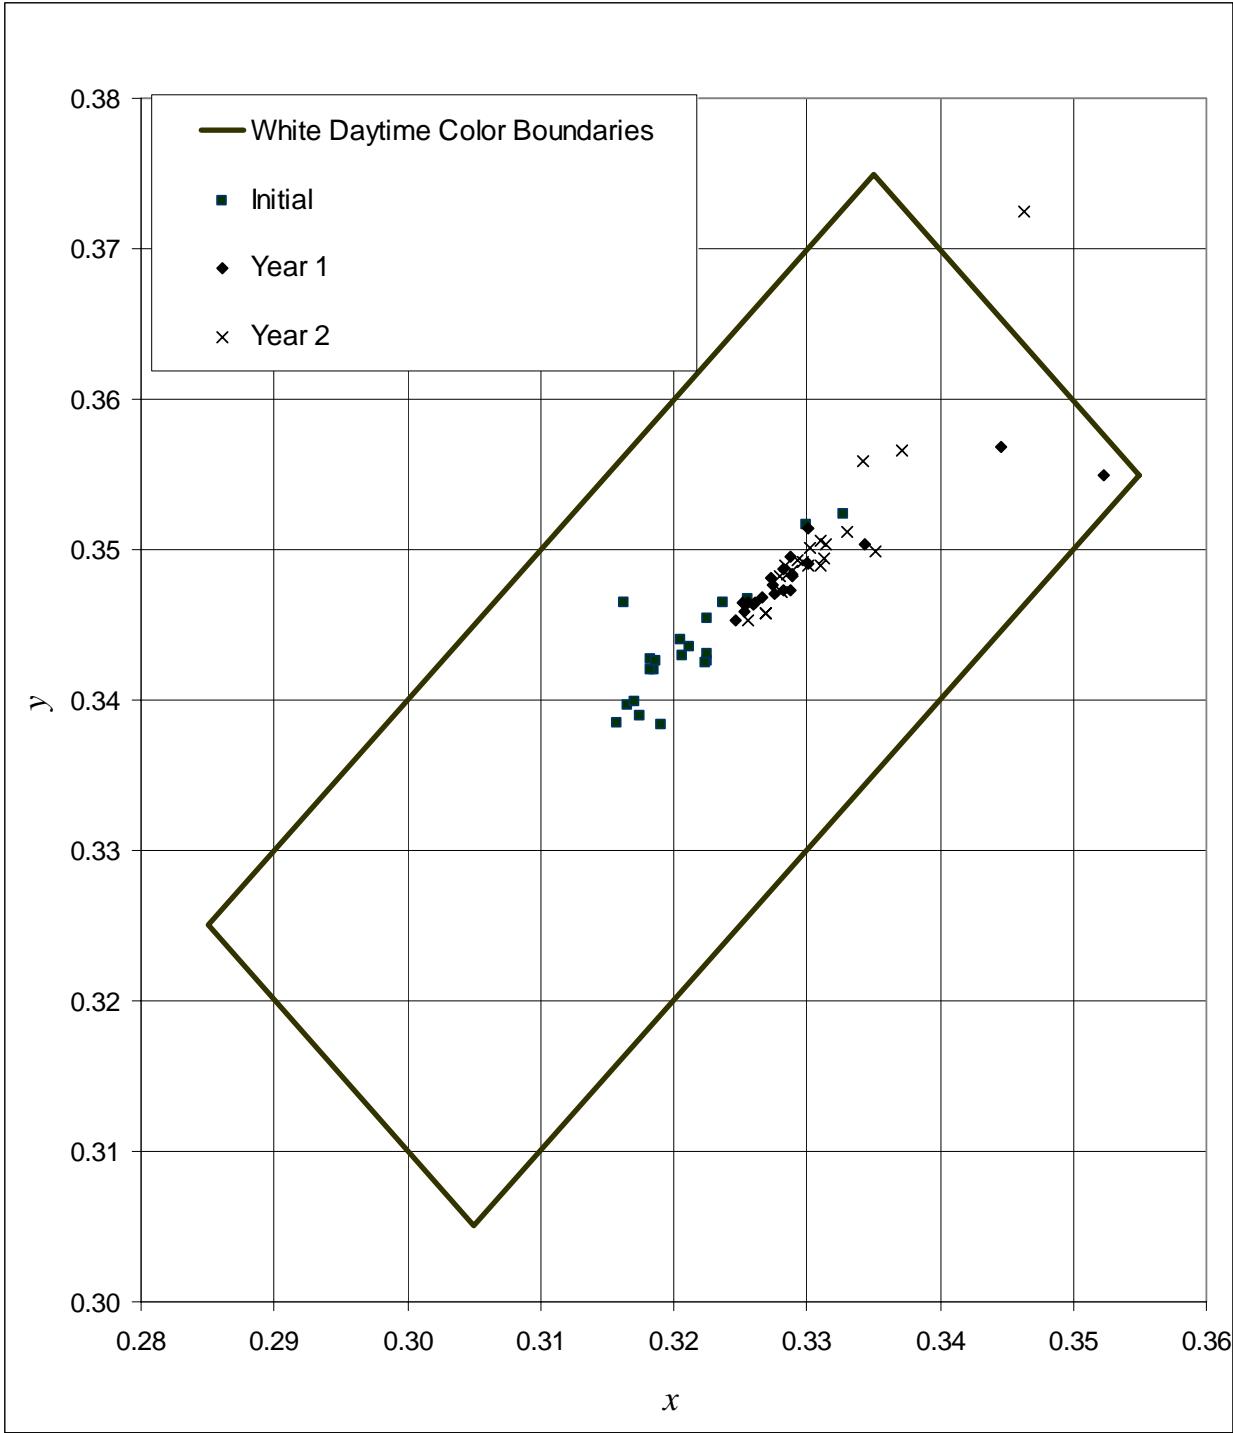

Figure 30. Chromaticity Values for White Markings.

Figure 31. Chromaticity Values for Red Markings.

Figure 32. Chromaticity Values for Blue Markings.

Color stability can be described by describing color change from an initial value to a later measurement as a vector in this three-dimensional color space. This vector is delta-E and represents the distance between two points in color space. As such, it represents changes in chromaticity (x,y) as well as hue value (cap-Y). The delta-E values for each of the materials are presented in [Appendix F](#). They were calculated from the initial, new color readings compared to the Year 1 and Year 2 readings. In addition to the delta-E values, the tables in [Appendix F](#) report a Pass/Fail grade for each colored material depending on whether the color stayed in the color box specified by FHWA over the two-year period.

Another way to examine the color data is to examine the cap-Y values for the white markings. These values serve as an indication of darkening due to dirt accumulation. The test decks were represented different pavement types, in part, to discover the effect of pavement type on dirt accumulation. [Figure 33](#) through [Figure 35](#) illustrate cap-Y values for each product for the three pavement types tested. For the seal coat and asphalt pavements, the cap-Y values of the majority of the products fall below the minimum value of 35 that the FHWA recommends for new markings. These low cap-Y values can become an issue for daytime visibility because a lower value of cap-Y corresponds to a gray appearance, which may not provide adequate contrast with the surrounding pavement.

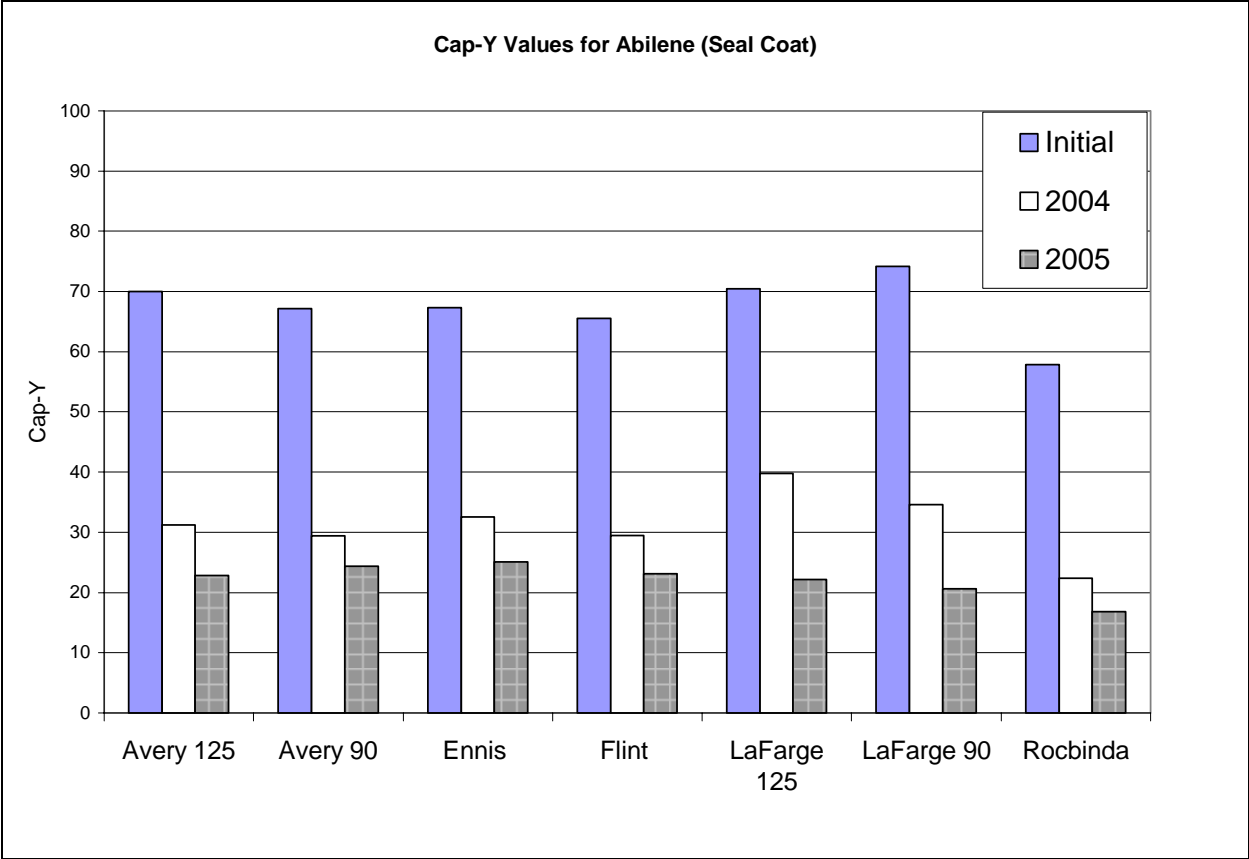

Figure 33. Cap-Y Values for White Markings on Seal Coat Pavement.

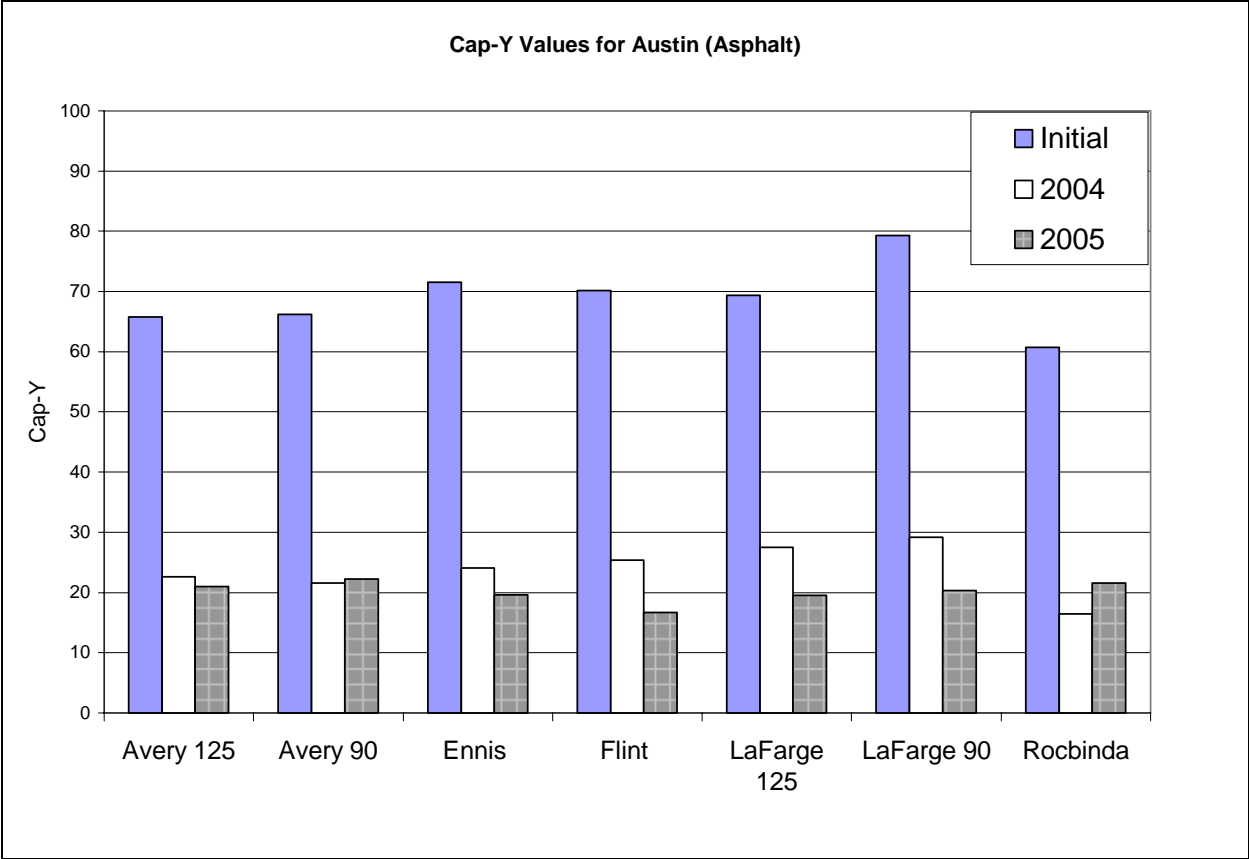

Figure 34. Cap-Y Values for White Markings on Asphalt Pavement.

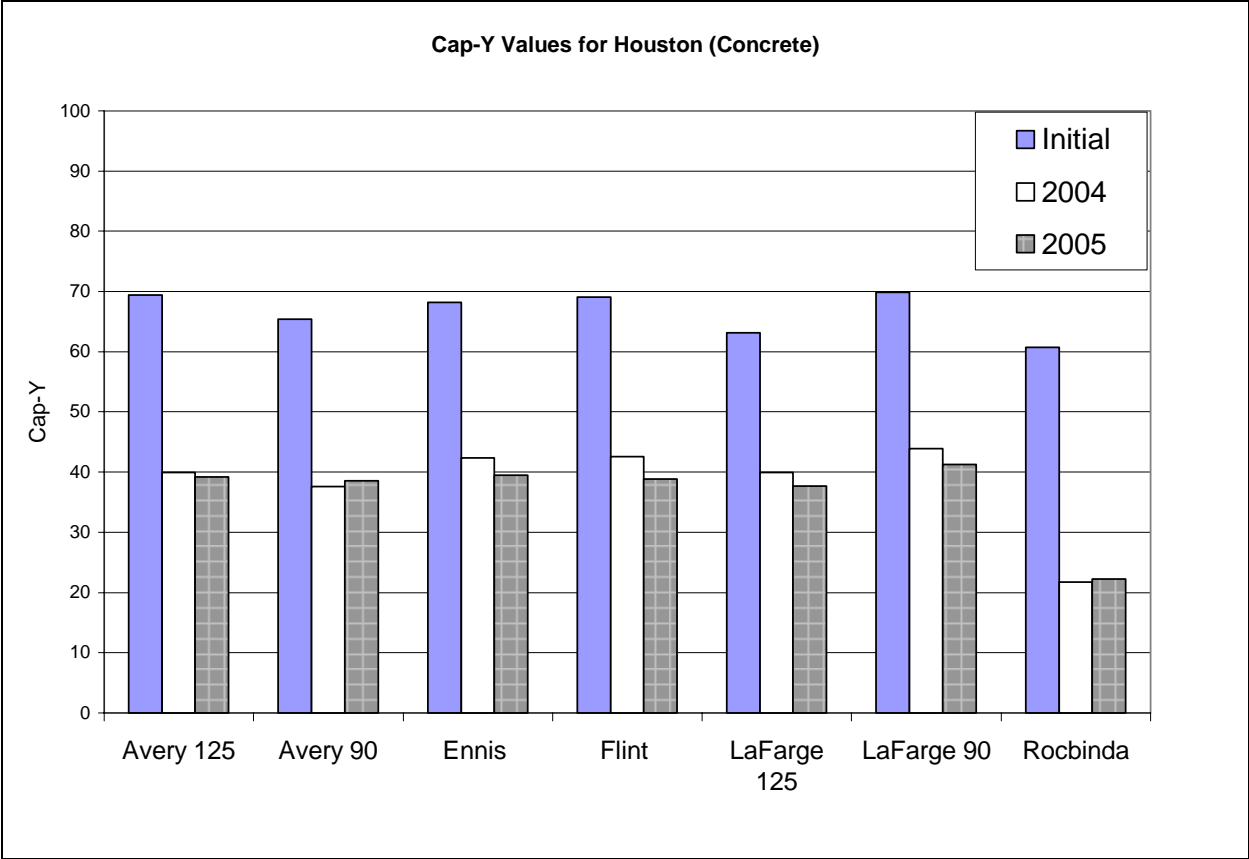

Figure 35. Cap-Y Values for White Markings on Concrete Pavement.

CHAPTER 4: RECOMMENDATIONS FOR ADDITIONS OR REVISIONS TO TXDOT'S TRAFFIC CONTROL STANDARDS SHEETS

An earlier part of this project examined the operational effects of a variety of horizontal signing applications. These efforts were documented in an earlier report ([1](#)). These earlier studies showed small and mixed results for applications to reduce speeds at horizontal curves on rural two-lane roads. The project monitoring committee did not feel that these results supported widespread application of any of these treatments. The application of directional arrows to reduce wrong-way movements on two-way frontage roads, however, showed very promising results. At the request of the project monitoring committee, the researchers have developed a typical layout diagram for application of directional arrows. This layout can be found in [Appendix G](#).

CHAPTER 5: CONCLUSIONS AND RECOMMENDATIONS

Preformed thermoplastic materials are recommended for horizontal applications with the following considerations:

- Confirm that the product has been tested on an AASTHO NTPEP test deck.
- Assure proper installation surface preparation as recommended by vendors (sweeping, etc.), particularly if larger sheets of preformed materials will be installed.
- Avoid overheating and scorching the material during installation.
- Use materials within one year of purchase to avoid discoloration before installation.
- When use is desired on chip seal pavement, consider using a product with a black border to enhance contrast. Products tested in this project became dirty when installed two weeks after the application of a of seal coat.
- New products and manufacturers are continually entering the market; users should work with the Construction Division Materials and Testing Laboratory and the TxDOT New Products committee to get the best estimate of performance before installation.

VENDOR SURVEYS**

INDUSTRY SURVEY FOR HORIZONTAL SIGNING

Company: 3M

Name: Jeff Low

Phone: 512-415-2658

Email: _____

1. What specific types of durable pavement marking materials does your company recommend for use as horizontal signing applications placed in the travel lanes on **urban concrete or asphalt** roadway surfaces with **high traffic** (average daily traffic > 100,000 vehicles)? Please list materials that are suitable for the following applications:

A. Route Shields

Product ID numbers or name: _____
Type of material: _____
How is the material applied? _____
Approximate contracted cost for materials and application: _____
Recommended thickness: _____
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

B. Symbols/Words

Product ID numbers or name: 380
Approximate contracted cost for materials and application: _____
Recommended thickness: _____
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

C. Transverse Lines

Product ID numbers or name: 380
Approximate contracted cost for materials and application: _____
Recommended thickness: _____
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

2. What specific types of durable pavement marking materials does your company recommend for use as horizontal signing applications (e.g. words, symbols, transverse bars) placed in the travel lanes on **rural asphalt or chipseal** roadway surfaces with **low-medium traffic**? Please list materials that are suitable for the following applications:

A. Symbols/Words

Product ID numbers or name: _____
Approximate contracted cost for materials and application: _____
Recommended thickness: _____
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

B. Transverse Lines

Product ID numbers or name: _____
Approximate contracted cost for materials and application: _____
Recommended thickness: _____
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

3. Have any of the materials listed above been included in a NTPEP (or similar) evaluation and if so, does a publication exist?

NTPEP

Penn '00: 820 Tape - Concrete = Good, Asphalt = Good
380 Tape (Experimental) - Concrete = Good, Asphalt = Good

Cal '00: 820 Tape - Concrete = Marginal, Asphalt = Good

4. Please provide contact information for agencies that have used your products for route shield markings or other innovative applications.

5. Please provide us with a website or product information pamphlets.

6. What specific types of durable pavement marking materials does your company recommend for use as horizontal signing applications placed in the travel lanes on **urban concrete or asphalt** roadway surfaces with **high traffic** (average daily traffic > 100,000 vehicles)? Please list materials that are suitable for the following applications:

A. Route Shields

Product ID numbers or name: City Tape (need a huge order to get custom order)
Type of material: Permanent tape (thermoplastic) with adhesive
How is the material applied? By hand
Approximate contracted cost for materials and application: _____
Recommended thickness: 90 mil
Range of ambient air temperatures for application: 40°
Approx. no-track drying time: _____
Recommended surface preparation: Clean and dry
Recommended primer/sealer (if any): Primer on concrete

B. Symbols/Words

Product ID numbers or name: City Tape
Approximate contracted cost for materials and application: \$125 per symbol
Recommended thickness: 90 mil
Range of ambient air temperatures for application: 40°
Approx. no-track drying time: _____
Recommended surface preparation: Clean and dry
Recommended primer/sealer (if any): Primer on concrete

C. Transverse Lines

Product ID numbers or name: City Tape
Approximate contracted cost for materials and application: 4" - \$0.58 per foot
Recommended thickness: 90 mil
Range of ambient air temperatures for application: 40°
Approx. no-track drying time: _____
Recommended surface preparation: Clean and dry
Recommended primer/sealer (if any): Primer on cone

7. What specific types of durable pavement marking materials does your company recommend for use as horizontal signing applications (e.g. words, symbols, transverse bars) placed in the travel lanes on **rural asphalt or chipseal** roadway surfaces with **low-medium traffic**? Please list materials that are suitable for the following applications:

A. Symbols/Words

Product ID numbers or name: City Tape
Approximate contracted cost for materials and application: _____
Recommended thickness: 90 mil
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

B. Transverse Lines

Product ID numbers or name: City Tape
Approximate contracted cost for materials and application: _____
Recommended thickness: 90 mil
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

8. Have any of the materials listed above been included in a NTPEP (or similar) evaluation and if so, does a publication exist?

Mississippi 2002
PennDot 2002

9. Please provide contact information for agencies that have used your products for route shield markings or other innovative applications.

NONE

10. Please provide us with a website or product information pamphlets.

www.roadtape.com

INDUSTRY SURVEY FOR HORIZONTAL SIGNING

Company: ATM

Name: Ron Sims

Phone: 601-260-3175

Email: rsims2001@yahoo.com

11. What specific types of durable pavement marking materials does your company recommend for use as horizontal signing applications placed in the travel lanes on **urban concrete or asphalt** roadway surfaces with **high traffic** (average daily traffic > 100,000 vehicles)? Please list materials that are suitable for the following applications:

A. Route Shields

Product ID numbers or name: Custom ATM 400
Type of material: They can make custom colored and shaped products
How is the material applied? Would need CAD drawings
Approximate contracted cost for materials and application: _____
Recommended thickness: Probably use ATM 300 products
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

B. Symbols/Words

Product ID numbers or name: ATM 400 white & yellow 4" up to 24"
Approximate contracted cost for materials and application: \$ 96.30 per 90' roll (4"), \$3.21 per sft for symbols
Recommended thickness: 90 mil - for higher shear areas
Range of ambient air temperatures for application: 40° and rising
Approx. no-track drying time: N/A
Recommended surface preparation: _____
Recommended primer/sealer (if any): Pressure sensitive adhesive is on the material

C. Transverse Lines

Product ID numbers or name: SAME
Approximate contracted cost for materials and application: _____
Recommended thickness: _____
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

12. What specific types of durable pavement marking materials does your company recommend for use as horizontal signing applications (e.g. words, symbols, transverse bars) placed in the travel lanes on **rural asphalt or chipseal** roadway surfaces with **low-medium traffic**? Please list materials that are suitable for the following applications:

A. Symbols/Words

Product ID numbers or name: ATM 300: 60 mil - or - ATM 180 45 mil
Approximate contracted cost for materials and application: \$59.00 per 90' roll, \$51.13 per 90' roll
Recommended thickness: _____
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): Pressure sensitive adhesive

B. Transverse Lines

Product ID numbers or name: ATM 300 or ATM 180
Approximate contracted cost for materials and application: _____
Recommended thickness: _____
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

13. Have any of the materials listed above been included in a NTPEP (or similar) evaluation and if so, does a publication exist?

ATM 300 and 400 are in NTPEP evaluations, not sure of locations Texas

14. Please provide contact information for agencies that have used your products for route shield markings or other innovative applications.

Call Brenda Robbins contact the main office, some stuff with border authority in N.Y.

15. Please provide us with a website or product information pamphlets.

www.trafficmarking.com - facility management page

INDUSTRY SURVEY FOR HORIZONTAL SIGNING

Company: Avery Dennison

Name: Bill Quincy

Phone: 512-219-8600

Email: _____

16. What specific types of durable pavement marking materials does your company recommend for use as horizontal signing applications placed in the travel lanes on **urban concrete or asphalt** roadway surfaces with **high traffic** (average daily traffic > 100,000 vehicles)? Please list materials that are suitable for the following applications:

A. Route Shields

Product ID numbers or name: "Hot Tape" - many colors
 Type of material: Preformed thermo
 How is the material applied? By torch
 Approximate contracted cost for materials and application: cuts
 Recommended thickness: 125 mil
 Range of ambient air temperatures for application: Any (must preheat pavement)
 Approx. no-track drying time: _____
 Recommended surface preparation: Heat pavement (300°), clean and dry
 Recommended primer/sealer (if any): Primers on polished surfaces only

B. Symbols/Words

Product ID numbers or name: Hot Tape
 Approximate contracted cost for materials and application: \$1.25 per sft
 Recommended thickness: _____
 Range of ambient air temperatures for application: _____
 Approx. no-track drying time: Takes about 10 min per arrow
 Recommended surface preparation: _____
 Recommended primer/sealer (if any): _____

C. Transverse Lines

Product ID numbers or name: Hot tape
 Approximate contracted cost for materials and application: \$1.25 per sft
 Recommended thickness: _____
 Range of ambient air temperatures for application: _____
 Approx. no-track drying time: _____
 Recommended surface preparation: _____
 Recommended primer/sealer (if any): _____

17. What specific types of durable pavement marking materials does your company recommend for use as horizontal signing applications (e.g. words, symbols, transverse bars) placed in the travel lanes on **rural asphalt or chipseal** roadway surfaces with **low-medium traffic**? Please list materials that are suitable for the following applications:

A. Symbols/Words

Product ID numbers or name: Hot tape
Approximate contracted cost for materials and application: _____
Recommended thickness: 125 mil
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

B. Transverse Lines

Product ID numbers or name: Hot tape
Approximate contracted cost for materials and application: _____
Recommended thickness: 125 mil
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

18. Have any of the materials listed above been included in a NTPEP (or similar) evaluation and if so, does a publication exist?

NTPEP

Penn '00: Pavemark (P.F. Thermo) - Concrete = Marginal, Asphalt = Marginal
Hot Tape (P.F. Thermo) - Concrete = Marginal, Asphalt = Marginal

Miss '99: Hot Tape (P.F. Thermo) - Concrete = Marginal, Asphalt = Marginal

19. Please provide contact information for agencies that have used your products for route shield markings or other innovative applications.

Company: LaFarge

Name: Dave Vallanni Kevin Francis

Phone: (404) 767 – 0569 x33 (570) 546 - 6041

Email: _____

46. What specific types of durable pavement marking materials does your company recommend for use as horizontal signing applications placed in the travel lanes on **urban concrete or asphalt** roadway surfaces with **high traffic** (average daily traffic > 100,000 vehicles)? Please list materials that are suitable for the following applications:

A. Route Shields

Product ID numbers or name: ColorLine (a.k.a. thermaline in colors)

Type of material: P.F. thermo (unique polymer), 90 mils or 125 mils

How is the material applied? Torch @ 400 – 450 deg. (recommend push cart torch)

Approximate contracted cost for materials and application: depending on color

Recommended thickness: 4" (about 50 cents per foot)

Range of ambient air temperatures for application: Any temp with torch (either preheat or non-preheat pavement)

Approx. no-track drying time: N/A

Recommended surface preparation: Dry & heat

Recommended primer/sealer (if any): On concrete

B. Symbols/Words

Product ID numbers or name: ColorLine/thermaline

Approximate contracted cost for materials and application: _____

Recommended thickness: 125 mil

Range of ambient air temperatures for application: _____

Approx. no-track drying time: _____

Recommended surface preparation: _____

Recommended primer/sealer (if any): _____

C. Transverse Lines

Product ID numbers or name: ColorLine/thermaline - Also have sprayed or extruded "normal" DMS8220 thermo

Approximate contracted cost for materials and application: _____

Recommended thickness: 125 mil

Range of ambient air temperatures for application: _____

Approx. no-track drying time: _____

Recommended surface preparation: _____

Recommended primer/sealer (if any): _____

47. What specific types of durable pavement marking materials does your company recommend for use as horizontal signing applications (e.g. words, symbols, transverse bars) placed in the travel lanes on **rural asphalt or chipseal** roadway surfaces with **low-medium traffic**? Please list materials that are suitable for the following applications:

A. Symbols/Words

Product ID numbers or name: ColorLine
Approximate contracted cost for materials and application: 60 mil or 90 mil
Recommended thickness: _____
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

B. Transverse Lines

Product ID numbers or name: _____
Approximate contracted cost for materials and application: _____
Recommended thickness: _____
Range of ambient air temperatures for application: _____
Approx. no-track drying time: _____
Recommended surface preparation: _____
Recommended primer/sealer (if any): _____

48. Have any of the materials listed above been included in a NTPEP (or similar) evaluation and if so, does a publication exist?

APPENDIX B: NTPEP FIELD TESTING PROCEDURES FOR PAVEMENT MARKINGS

A major resource for comprehensive pavement marking evaluations performed at the national level is the National Transportation Product Evaluation Program (NTPEP). NTPEP is responsible for testing and evaluating products, materials, and devices that are commonly used by the American Association of State Highway and Transportation Officials (AASHTO) member departments of transportation (DOTs). NTPEP evaluations of pavement marking materials are usually performed both in field and laboratory environments, with an emphasis on field performance of materials. Manufacturers voluntarily submit products for testing by NTPEP. NTPEP evaluations culminate in a formal report that is written by the state DOT in which the field evaluation was performed and is published and distributed by AASHTO. Test data are furnished in the report; however, per NTPEP/AASHTO policy, no approval, disapproval, or endorsements of products are made.

TTI researchers obtained and reviewed the following three recent NTPEP pavement marking reports:

- 2000 Urban California Test Deck (first year data), Report 02 NTPEP 216 (2);
- 2000 Pennsylvania Test Deck (first year data), Report 02 NTPEP 221 (3); and
- 1999 Mississippi Test Deck (second year data), Report 02 NTPEP 220 (4).

Each of the three reports was obtained because they included up-to-date performance data for pavement marking materials installed on both HMA and PCC roadway surfaces. The California report was of particular interest due to the high traffic volumes through the test sections. [Table 8](#) displays a summary of the characteristics of each site.

Table 8. NTPEP Site Characteristics.

Criteria		2000 Urban California	2000 Pennsylvania	1999 Mississippi
Location	Concrete	US 50 (WB ^a), Sacramento	I-80 (EB ^b), Williamsport	US 78 (WB ^a), New Albany
	Asphalt	US 50 (WB ^a), Sacramento	I-80 (WB ^a), Williamsport	US 78 (EB ^b), Tupelo
ADT	Concrete	160,000	10,000	20,000
	Asphalt	160,000	10,000	15,000
Material Installation Date		August 2000	July 2000	July 1999
Snowplowing?		No	Yes	No
Total Number of Materials Evaluated		33	180	100
Material Types		Thermo, Preformed Thermo, Permanent Tape, Polyurea, Modified Urethane	Paint, Thermo, Preformed Thermo, Permanent Tape, Removable Tape, Epoxy, Polyurea, Modified Urethane, Methyl Methacrylate, Experimental Products	Paint, Thermo, Preformed Thermo, Permanent Tape, Removable Tape, Epoxy

^a WB = westbound

^b EB = eastbound

In each evaluation, NTPEP field testing was performed according to the procedures developed by the NTPEP Subcommittee for Pavement Marking Materials, which are based on ASTM D 713-90: Standard Practice for Conducting Road Service Tests on Fluid Traffic Marking Materials. In each evaluation, all pavement marking materials were installed on both bituminous asphalt surface and Portland cement concrete surface. The material manufacturers, under the supervision of the lead agency, were responsible for placement of their respective striping materials. Multiple beaded transverse lines were placed for each material sample. Lines extended across the right lane from the left side of the right edgeline to the left side of the lane line. Primers/sealers were used with selected thermoplastic and tape materials.

In each case, the marking materials were evaluated based on the field testing procedures described in ASTM D 713-90. The lead agency for each evaluation performed all field data collection. Field data were initially collected within the first few days after application.

Subsequent data collection was performed at monthly intervals for the first year after application and at quarterly intervals during the second year¹. The following field data were collected for each material sample during each data collection event:

- subjective rating of the durability and appearance,
- quantitative retroreflectivity measurement (30 m geometry [for consistency with earlier text]), and
- quantitative color measurement².

Subjective ratings of durability were made by a team of trained evaluators.

Retroreflectivity measurements were made using a portable handheld retroreflectometer with 30 m geometry. Durability and retroreflectivity measurements were obtained in two locations for each transverse sample line:

- within the 18 inch left wheel path area to approximate maximum wear conditions and
- within the 9 inch area at the lane line to approximate normal wear conditions.

Material durability was determined by estimating the percentage of the stripe remaining (non-exposed substrate) at each of the two locations on the line. Durability ratings were assigned by taking 10 percent of the percentage remaining (e.g., 60 percent remaining equals a durability rating of 6). Durability ratings were therefore reported on an integer scale from 0 to 10.

¹ The California and Pennsylvania reports include first-year data only, as second-year data have not yet been reported. The Mississippi report includes only second-year data.

² Color measurements were not necessarily performed during every data collection event.

APPENDIX C: MATERIALS INSTALLED AND MEASUREMENTS TAKEN

Tables 9 through 17 in this appendix document the types of materials installed at each location. In addition, the status of each sample and the measurements taken are indicated. In some cases, the material failed to adhere to the pavement and was missing at the time of measurement. In other cases, the researchers failed to get a valid measurement due to oversight or equipment malfunction in the field.

A check mark (√) denotes that a sample was present and measurements were taken. A dash (-) denotes that no sample was provided of that type. An O denotes that the sample had failed and was missing from the test deck. An X denotes missing data due to researcher or equipment error.

<i>Comments:</i>									

APPENDIX F: COLOR DATA

Delta-E values (DE) were calculated compared to initial color values and are reported in Tables 26 through 33. Pass/Fail (P/F) grades were assigned based on whether the product stayed within the FHWA color box at the end of two years. A product received a failing grade for failing in terms of the chromaticity values or the cap-Y values. Grades could not be assigned for yellow-green and purple markings (N/A) because no FHWA specifications exist for these colors.

A dash (-) denotes that no sample was provided of that type. An X denotes missing data. A O denotes that the product had failed and the sample was missing.
