

Traffic Signal Operations Workshop

An Engineer's Guide to Traffic Signal Timing and Design

Course Notes

Product 0-5629-P2

TRAFFIC SIGNAL OPERATIONS WORKSHOP

Date: Location: Contacts:	Jim Bonneson, (979) 845-9906, j-bonneson@tamu.edu
	Agenda
(Agenda tim	es to be determined based on workshop focus)
Introduction	
Session 1: S	Signal Controller Timing
Session 2: S	Signal Coordination Timing
Session 3: S	Signal Phasing and Operation
Session 4: A	Advanced Signal Timing Settings
Session 5: I	Detection Design and Operation
Session 6: I	Diamond Interchange Operations

Traffic Signal Operations Handbook
Traffic Signal Coordination Optimizer Software (TSCO)

Course Materials:

Course Notes

Traffic Signal Timing and Detection Design

Traffic Signal Operations Workshop

Welcome

- Introductory Session
 - Objective, outcome, scope
 - Background
 - Handbook and Workshop Organization
 - Agenda

Objective & Outcome

- Objective
 - To inform participants about...
 - Effective signal timing and design practices
 - Availability of tools to assist with timing and design
 - To demonstrate how to apply these tools
- Outcome
 - Participants should be able to...
 - Determine effective signal settings and detection layout
 - Apply the evaluation tools

Scope

- Scope
 - Workshop is intended to show engineers and technicians how various guidelines and tools can be used to develop effective signal timing and detection design
 - Participant is assumed to have a working knowledge of traffic signal equipment and the authority to make, or recommend, changes to the operation of this equipment

Background

- Project 0-5629
 - "Best TxDOT Practices for Signal Timing and Detection Design"
 - Project Director:
 - Henry Wickes
 - Key product:
 - Traffic Signal Operations Handbook

• Information Development Process Past TXDOT Research National Research (FHWA, TRB) 0-5629 Research

Handbook Organization

- Organization Objectives
 - Quick-response
 - Easy to find guidelines by locating in one location
 - Easy to use guidelines via table look-up and figures
- Chapters
- Appendices
- Overview
- Overview
- Concepts
- Concepts

Guidelines

- Procedure
- (Guidelines)

				_	
Han	dha	sk C)raar	nizatio	n
ııaıı	ubu	JN L	ı uaı	IIZauv	,,,

- Concepts
 - Defines controller features and design terms
 - Something you read once
 - Experienced persons may not need this section
- Procedure
 - Describes typical steps in signal timing
 - Something you read once
- Guidelines
 - Information about where, when, what to use
 - Information you use all the time

Workshop Organization

- **Organization Objectives**
 - Chapter by chapter (appendix by appendix)
 - Within a chapter or appendix
 - One topic at a time (e.g., minimum green)
 - · Brief review of concepts
 - Detailed discussion of guidelines
 - Example application of guidelines
 - Exercises to practice use of guidelines
 - Two items to note...
 - Emphasis is on GUIDELINES
 - · In the Handbook, concept material on a topic is not adjacent to guideline material on a topic

Agenda

- Session 1:
 - Signal Controller Timing
- Session 2:
 - Signal Coordination Timing
- Session 3:
 - Signal Phasing and Operation
- Lunch Break

Agenda

- Session 4:
 - Advanced Signal Timing Settings
- Session 5:
 - Detection Design and Operation
- Session 6:
 - Diamond Interchange Operations

Policy on Questions

- Policy Points
 - Questions are encouraged
 - Please ask them as they occur to you

Questions?

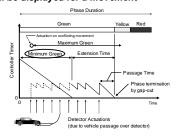

1. Signal Controller Timing

- Chapter 2 Guidelines
 - Phase settings
 - Minimum green setting
 - Maximum green setting
 - Yellow change interval
 - Red clearance interval
 - Phase recall mode
 - Passage time
 - Detector settings
 - Pedestrian settings

Minimum Green Setting

- Concepts
 - The least amount of time that a green indication will be displayed for a movement

Minimum Green Setting

- Guidelines
 - Considerations for selecting min. green
 - Driver expectancy
 - Queue clearance
 - Pedestrian crossing time
 - Each consideration has a different minimum green requirement
 - Consider all that apply and use the largest

Minimum Green Setting

- Driver Expectancy
 - Applies to every phase

Phase	Approach Type	Minimum Green, s
Through	Major-road	8 to 15
Through	Minor-road	5 to 10
Left-turn	All	5 to 8

Minimum Green Setting

- Queue Clearance
 - Applies when
 - Advance-only detection is used
 - Variable initial is not used

Distance between Stop Line and Detector, ft	Minimum Green, s
0 to 25	5
26 to 50	7
51 to 75	9
76 to 100	11
101 to 125	13
126 to 150	15

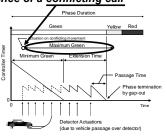

Minimum Green Setting

- Pedestrian Crossing Time
 - Applies when
 - Phase serves a through movement
 - Pedestrian push button not provided
 - Pedestrian demand is likely to exist
 - Minimum Green (Gp)
 - Gp = W + PCI
 - where,
 - W = walk interval (4 to 7 s)
 - PCI = pedestrian change interval (10 to 30 s)
 - · Variables discussed later in this session

Maximum Green Setting

- Concepts
 - Maximum time of green display in the presence of a conflicting call

Maximum Green Setting

- Guidelines
 - Major-road through phase
 - Minor-road through phase
 - Left-turn movement phase

Maximum Green Setting

- Major-Road Through Phase
 - 1) At least 30 seconds
 - 2) At least 10 seconds longer than the minimum green setting
 - 3) At least as long, in seconds, as 1/10th the peakperiod volume, in vehicles per hour per lane

Maximum Green Setting

- Major-Road Through Phase
 - 1) At least 30 seconds
 - 2) At least 10 seconds longer than the minimum green setting
 - 3) At least as long, in seconds, as 1/10th the peakperiod volume, in vehicles per hour per lane
- Example:
 - Vol. = 360 veh/h/ln, min. green = 12 s
 - Max. green = $larger of: (30, 12+10, 0.1 \times 360)$
 - Max. green = 36 s

Maximum Green Setting

- Minor-Road Through Phase
 - 1) At least 20 seconds
 - 2) At least 10 seconds longer than the minimum green setting
 - 3) At least as long, in seconds, as 1/10th the peakperiod volume, in vehicles per hour per lane

Maximum Green Setting

- Left-Turn Movement Phase
 - 1) At least 15 seconds
 - 2) At least 10 seconds longer than the minimum green setting
 - 3) At least <u>half as long as the maximum green for</u> the adjacent through movement

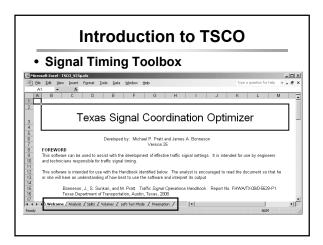

Maximum Green Setting

- Left-Turn Movement Phase
 - 1) At least 15 seconds
 - 2) At least 10 seconds longer than the minimum green setting
 - 3) At least <u>half as long as the maximum green for</u> the adjacent through movement
- Example
 - Min. green = 6 s
 - $Max. green = larger of: (15, 6+10, 0.5 \times 36)$
 - Max. green = 18 s

Example Problem

- Application
 - Maximum green setting
- Calculation Tool
 - Traffic Signal Coordination Optimizer (TSCO)
- Organization
 - Introduce TSCO
 - Work example problem using TSCO

Introduction to TSCO

- TSCO Tools
 - Analysis
 - Timing plan evaluation and optimization
 - Splits
 - Phase split calculation
 - Volumes
 - Turn movement count estimation
 - Left-Turn Mode
 - When to use protected left-turn phases
 - Preemption
 - Preemption worksheet for highway-rail crossings

Introduction to TSCO

- TSCO Instructions
- Click On:

 Volumes /
- Inputs: blue cells, drop-down, check boxes
- Intermediate calculations: white cells
- Results: purple cells

Values AV sub-A C = 1.2.2 QV	26	290	- 14	120	20	122	29	100

Example 1: Maximum Green

- Step 3: Determine Maximum Green Setting
 - 1) At least 30 seconds

G_{max} = 30 s

2) At least 10 seconds longer than the minimum green setting

 $G_{max} = 10 + 10 = 20 s$

3) At least as long, in seconds, as 1/10th the peakperiod volume, in vehicles per hour per lane

V = 430/2 = 215 veh/h/ln

 $G_{max} = 0.1 \times 215 = 22 \text{ s}$

Example 2: Maximum Green

- Given
 - AADTs for an intersection
- The Questions
 - What is the peak-period through volume for each road?
 - What is the maximum green setting for ...
 - Major-road westbound through phase?
 - Minor-road northbound through phase?
 - Major-road eastbound left-turn phase?

Example 2: Maximum Green

- The Data
 - AADT
 - Major (E/W): 15,500 veh/d
 - Minor (N/S): 7,500 veh/d
 - Functional class
 - Both: arterial

 Configuration
 - Configuration
 - Both: 2 through lanes per approach
 - Minimum green settings
 - Major (E/W) left-turn phases: 6 s
 - Major (E/W) through phases: 12
 - Minor (N/S) through phases: 14 s
- · Work for 5 minutes

Volume, veh/h	S	Shortest	Minimum Green+10	Volume		

Yellow Change Interval

Concepts

- Intended to alert a driver of an impending presentation of red indication
- TMUTCD guidance
 - Range: 3 to 6 s
 - Longer values used for higher speeds

Yellow Change Interval

Guidelines

- ITE method
 - Equation: $Y = 1.0 + \frac{1.47 \text{ V}}{20.104}$
 - udana
 - Y = yellow change interval (3 to 6 s)
 - V = approach speed (mph)
 - g = approach grade (ft/ft)

Speed, mph	25	30	35	40	45	50	55	60
Yellow, s	3.0	3.2	3.6	3.9	4.3	4.7	5.0	<u>5.4</u>

Yellow Change Interval

Guidelines

- Rounding to 5.0 s
 - If Y > 5.0, many engineers round down to 5.0 s
 - If you do this...
 - Apply consistently at all intersections
 - Include the difference as a grace period when camera enforced

Speed, mph								
Yellow, s	3.0	3.2	3.6	3.9	4.3	4.7	5.0	<u>5.0</u>

Yellow Change Interval

• Guidelines

- Approach speed

- Through movements
 - 85th percentile
 - Posted speed limit
 - Be consistent
- Left-turn movements
 - Average of through speed and 20 mph

Through Speed, mph	Left-Turn Speed, mph
25 to 34	25
35 to 44	30
45 to 54	35
55 to 64	40
65 to 74	45

Red Clearance Interval

Concepts

- A brief period of time after the yellow indication during which the ending phase and all conflicting phases display a red indication
- TMUTCD guidance
 - Optional
 - Not greater than 6 s

Red Clearance Interval

Guidelines

- ITE method
 - Equation: Rc = W+L
 - where,
 - Rc = red clearance interval (6 s or less)
 - W = width of intersection (+ cross walk)
 - L = length of design vehicle (use 20 ft)
 - V = approach speed

Red Clearance Interval

Guidelines

- Intersection width (W)
 - Stop line to far edge of last conflicting lane
 - May extend to beyond crosswalk

- Left-turn movements

• Use a straight line approximation of path

Red Clearance Intervals

• Guidelines

- Typical values
- Underlined values based on Y = 5.0 s

Approach Speed, mph	Intersection Width, ft				
Speed, Inpil	50	70	90	110	
30	1.6	2.0	2.5	3.0	
40	1.2	1.5	1.9	2.2	
50	1.0	1.2	1.5	1.8	
60	<u>1.2</u>	<u>1.4</u>	<u>1.7</u>	<u>1.9</u>	

Phase Recall Mode

Concepts

- Recall causes the controller to place a call for a specified phase when the controller is serving a conflicting phase
- Types
 - Minimum recall
 - Maximum recall
 - Pedestrian recall
 - Soft recall

Phase Recall Mode

Concepts

- Minimum recall
 - Continuous call until the minimum green times out
- Maximum recall
 - Continuous call until the maximum green times out
- Pedestrian recall
 - Continuous call for pedestrian service until the pedestrian change interval times out
- Soft recall
 - Call on a phase in the absence of any calls on a conflicting phase

Phase Recall Mode

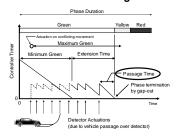

Guidelines

- Minimum recall
 - Use on major-road through phases if no detection
- Maximum recall
 - Use during detector failure
 - Use to emulate pretimed operation
- Pedestrian recall
 - Use when pedestrians are present every cycle
- Soft recall
 - Use on major-road through phases with detection

-		

Passage Time

- Concepts
 - Maximum amount of time a vehicle actuation can extend the green interval

Passage Time

- Guidelines
 - Duration based on three goals
 - Ensure queue clearance
 - Satisfy driver expectancy (no unneeded extension)
 - Reduce max-out frequency
 - Equation
 - PT = MAH -
 - 1.47 V - where,

- MAH = maximum allowable headway (3.0 s)
- Lv = detected length of vehicle (17 ft)
- Ld = length of detector (ft)
- V = approach speed (mph)

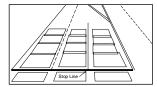

Passage Time

- Guidelines
 - Stop line presence detection
 - Inductive Loop
 - Rule of thumb
 - PT = 85th % speed in mph / 20

Detection	85 th Percentile Speed, mph						
Zone Length,	20	25	30	35	40		
11	Passage Time (<i>PT</i>), s ¹						
20	1.5	2.0	2.0	2.0	2.5		
40	1.0	1.0	1.5	1.5	2.0		
60	0.0	0.5	1.0	1.5	1.5		
80	0.0	0.0	0.5	1.0	1.0		
	40 60	20 1.5 40 1.0 60 0.0	Zone Length, ft 20 25 20 1.5 2.0 40 1.0 1.0 60 0.0 0.5	Zone Length, ft 20 25 30 Passage Time (PT), 20 1.5 2.0 2.0 40 1.0 1.0 1.5 60 0.0 0.5 1.0	Zone Length, ft 20 25 30 35 Passage Time (PT), s¹ 20 1.5 2.0 2.0 2.0 40 1.0 1.0 1.5 1.5 60 0.0 0.5 1.0 1.5		

Passage Time

- Guidelines
 - Stop line presence detection
 - Video detection
 - PT = 0.0 s
 - Use long detection zone (discussed later)

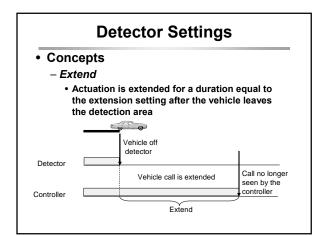

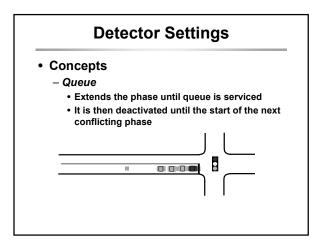

Detector Settings

- Concepts
 - Delay
 - Extend
 - Queue

Detector Settings Concepts Delay Actuation is delayed until the delay timer expires and the call is still present Vehicle detected by the detector detector by the controller Detector Controller Delay Time

Detector Settings Guidelines Delay Use with stop line presence-mode detection serving turn movements from exclusive lanes Right-turn movement If opportunity for right-turn on red then, Consider 8 to 14 s delay Left-turn movement If protected-permissive then, Consider 5 to 12 s delay

Pedestrian Settings

- Concepts
 - Walk interval
 - Time to alert pedestrian of opportunity to cross
 - WALK indication presented
 - Pedestrian change interval
 - Time to cross street
 - Flashing DON'T WALK indication presented

Pedestrian Settings

- Guidelines
 - Walk interval
 - TMUTCD guidance: 4 to 7 s

Conditions	Walk Interval Duration (W), s
High pedestrian volume areas (e.g., school, business district, etc.)	10 to 15
Typical pedestrian volume and longer cycle length	7 to 10
Typical pedestrian volume and shorter cycle length	7
Negligible pedestrian volume	4

Pedestrian Settings

- Guidelines
 - Pedestrian change interval (PCI)
 - Pedestrian walking speed
 - Pedestrian clearance time (PCT)

Pedestrian Settings

- Guidelines
 - Pedestrian walking speed
 - TMUTCD 4 fps
 - Other references 3.5 fps
 - Children and elderly pedestrians 3.0 fps
 - Pedestrian clearance time (PCT)
 - Equation: PCT = Dc/Vp
 - where,
 - Dc = curb to curb crossing distance (ft)
 - Vp = pedestrian walking speed (fps)
 - Pedestrian change interval (PCI)
 - Equation: PCI = PCT (Y + Rc)

Pedestrian Settings

Guidelines

- Pedestrian clearance time (PCT)

Pedestrian		Walking Speed, ft/s	
Crossing	3.0	3.5	4.0
Distance, ft	Pedesti	rian Clearance Time ((<i>PCT</i>), s
20	7	6	5
30	10	9	8
40	13	11	10
50	17	14	13
60	20	17	15
70	23	20	18
80	27	23	20
90	30	26	23
100	33	29	25

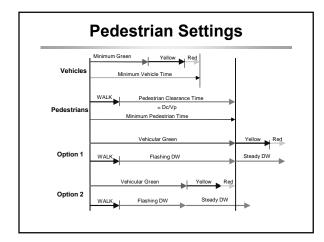

Pedestrian Settings

- Guidelines
 - Pedestrian change interval
 - Option 1
 - Display flashing DON'T WALK

$$PCI = PCT$$

- Option 2
 - Display flashing DON'T WALK before Y+Rc
 - Display solid DON'T WALK during Y + Rc

$$PCI = PCT - (Y + R_c)$$

Summary

- Chapter 2 Guidelines
 - Phase settings
 - Minimum green setting
 - Maximum green setting
 - · Yellow change interval
 - · Red clearance interval
 - Phase recall mode
 - Passage time
 - Detector settings
 - Pedestrian settings
- Questions?

2. Signal Coordination Timing

- Chapter 3 Guidelines
 - Coordination potential
 - System settings
 - Cycle length
 - Offset
 - Phase sequence
 - Force mode
 - Transition mode
 - Coordination mode
 - Phase settings
 - Phase splits
 - Dynamic splits
 - Maximum green

Coordination Potential

- Concepts
 - What intersections should be included in a coordinated signal system?
 - Considerations
 - Traffic volume
 - Segment length (distance between signals)
 - Speed
 - Access point activity
 - Cycle length
 - Signal system infrastructure

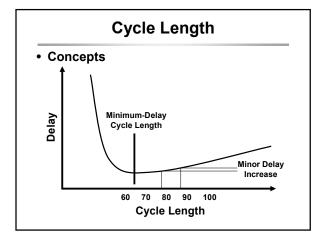

• Guidelines - Coupling index 2500 V = 2-way volume, vehrly L = segment length, ft

System Settings

- Settings Defining System Operation
 - Cycle length
 - Offset
 - Phase sequence
 - Force mode
 - Transition mode
 - Coordination mode

Cycle Length

- Concepts
 - Total time to complete one sequence of signalization of all movements at an intersection
 - Typical cycle length range
 - Minor arterial streets: 60 to 120 s
 - Major arterial streets: 90 to 150 s
 - Optimum cycle length based on...
 - Traffic volume, speed,
 - Intersection capacity, phase sequence
 - Segment length

Cycle Length

- Guidelines
 - Longer cycle lengths
 - Increase capacity (1 percent for 10 s increase)
 - More conducive to two-way progression
 - Increase queue length
 - Shorter cycle length
 - Reduce delay (if adequate capacity provided)
 - Under-saturated intersections
 - · Use minimum delay cycle length
 - Over-saturated intersections
 - Use shorter cycle length to minimize spillback

Cycle Length

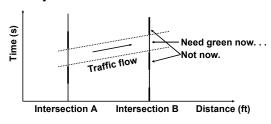

Guidelines

Average	Сус	Cycle Length by Street Class and Left-Turn Phasing, s							
Segment Length, ft	Major Arterial Street			Minor A	rterial Stree Network	t or Grid			
	No Left- Turn Phases	Left-Turn Phases on One Street	Left-Turn Phases on Both Streets	No Left- Turn Phases	Left-Turn Phases on One Street	Left-Turn Phases on Both Streets			
250				50	50	50			
500				60	90	100			
1000				50	90	120			
1500	90	120	150	60	80	120			
2000	100	120	140	80	90	100			
2500	90	140	150	100	100	120			
3000	90	100	160						
3500	100	120	120						
4000	110	120	140						
4500	120	120	150						
5000	140	140	150						

Offset

Concepts

Put green time where it is needed in the cycle to maximize flow

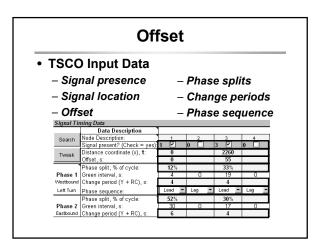

Offset

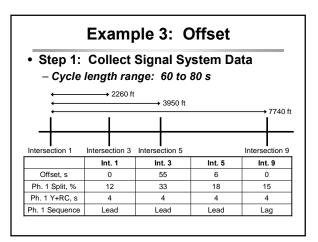

Guidelines

- When resources are available...
 - Use PASSER II or similar software tool
- When resources are not available...
 - Use "Kell Method" (in Handbook pp. 3-17 to 3-20)
 - Graphical solution for good two-way progression
 - Does not require traffic counts, just...
 - Progression speed
 - Splits
 - Signal spacing

• Guidelines - Start with Intersection A, then B, ... etc. - Center red or green on working line - Automated in TSCO Analysis Start with Intersection A, then B, ... etc. - Center red or green on working line - Automated in TSCO Analysis A Start with Intersection A, then B, ... etc. - Center red or green on working line - Automated in TSCO Analysis A Start with Intersection A, then B, ... etc. - Center red or green on working line - Automated in TSCO Analysis A Start with Intersection A, then B, ... etc.

Offset • Worksheet Controls ton Optimizer 52/2/2007 - Cycle length range Current • Minimum • Maximum - "Search" Find optimal offsets Data Description lode Description: Signal present? (Check = yes): 1 Distance coordinate (x), ft: 0 & cycle length - "Tweak" Phase split, % of cycle: Phase 1 Green interval, s: Westbound Change period (Y + RC), s: Left Turn • See if a small improvement in Left Turn Phase sequence: offsets is possible Offset Measures of Effectiveness - Bandwidth System Measures of Effectiveness Bandwidth, s: 27.0 Weighted Efficiency: 19.3% Fair Weighted Attainability: 75.1% Fine tune · Larger is better Efficiency • Larger is better - Attainability · Larger is better **Example 3: Offset** Goals 1) Find the optimum timing plan (cycle length and offsets) for a coordinated signal system Steps 1) Collect signal system data 2) Identify the optimum timing plan (use TSCO)

Example 3: Offset

• Step 1: Collect Signal System Data

	Int. 1	Int. 3	Int. 5	Int. 9
Ph. 2 Split, %	52	30	44	41
Ph. 2 Y+RC, s	6	4	6	6
Ph. 5 Split, %	20	30	12	14
Ph. 5 Y+RC, s	3	4	3	3
Ph. 5 Sequence	Lead	Lag	Lag	Lead
Ph. 6 Split, %	44	33	50	42
Ph. 6 Y+RC, s	6	4	6	6

- Progression speed: 40 mph

Example 3: Offset

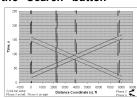

- Step 2: Identify Optimal Timing Plan
 - Enter input data
 - Enter cycle length range: 60 to 80 s
 - Uncheck the box for node 7
 - This data will be used later
 - Verify distance and offset data

Example 3: Offset

• Step 2: Identify Optimum Timing Plan

- Click the "Search" button

	Int. 1	Int. 3	Int. 5	Int. 9
Offset (s)	0	55	12	69
Cycle length: 7	0 s	Bandwid	th: 27.0 s	

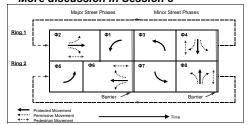

Example 4: Offset

- Given
 - The signal system from Example 3 and two alternative locations for a proposed new signal
- The Questions
 - What is the optimal offset for each alternative?
 - What is the optimal bandwidth for each alternative?
 - Which alternative is best?

Example 4: Offset • The Data - Same data as for Example 3, except... - New signal (check the box for node # 7) Alternative 1 - Distance (x): 4,800 ft from signal 1 - Offset: 30 s • Alternative 2 Distance (x): 5,200 ft from signal 1Offset: 30 s • Work for 5 minutes - Click "Tweak" to evaluate each option **Example 4: Offset** • The Answers - Alternative 1 (4,800 ft) **Example 4: Offset** • The Answers - Alternative 2 (5,200 ft)

Phase Sequence

- Concepts
 - Order by which the phases are presented
 - Lead-lead, lag-lag, lead-lag
 - More discussion in Session 3

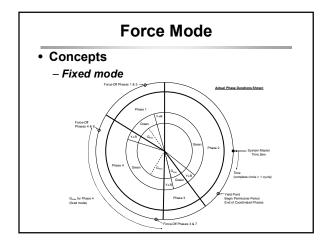

Phase Sequence

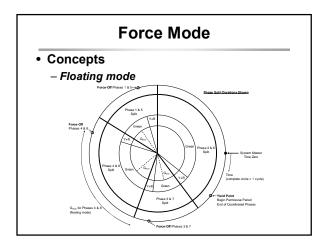

- Guidelines
 - Lead-lead
 - Most common
 - Lag-lag
 - Some districts use to improve efficiency with protected-permitted operations
 - · Watch out for yellow trap
 - Consider maximum recall for left-turn phase
 - Lead-lag
 - Can improve the quality of progression
 - Watch out for yellow trap
 - Consider maximum recall for lagging left-turn

Force Mode

Concepts

- Fixed mode
 - Excess time from an early non-coordinated phase available to a later non-coordinated phase
 - Usually more efficient than floating mode
- Floating mode
 - Excess time from all non-coordinated phases available to coordinated phase
 - Can be helpful IF an early return to the coordinated phase is desirable

Force Mode

- Guidelines
 - Fixed mode should be used unless...
 - Extensive queues exist for the coordinated movements at the start of green and
 - Minor movement volumes are low

Transition Mode

- Concepts
 - Used when a new timing plan is invoked
 - Dictates how phase splits and offset are altered for the next few cycles to reflect new plan
 - Modes
 - · Short-way
 - Truncates or lengthens phases as needed
 - Change is incremental and spread over several cycles
 - Dwell
 - Dwells in the coordinated phase until synchronized
 - Change occurs in one cycle

Transition Mode

- Guidelines
 - Choice of mode is based on...
 - Cycle length
 - Minor movement volume

Minor Movement	1 st Choice Tra	nsition Mode		
Volume	Short Cycle	Long Cycle		
Low	Dwell	Short-way		
High	Dwell or Short-way	Short-way		

Coordination Mode

- Concepts
 - Modes vary among controller types
 - Defines how and when minor movement calls received during coordinated phase are served
 - Simple mode
 - Any call received before yield point terminates phase and is served in sequence
 - Complicated mode
 - Only calls to next phase are considered just prior to their potential time period in sequence

Coordination Mode

- Guidelines
 - If pedestrian demand is significant then...
 - Consider a mode that allows the coordinated phase to dwell in the WALK indication
 - If volume on the cross street is light then...
 - Consider a mode that yields only to the next phase during the permissive yield period (or previous phase)

Phase Settings

- Settings Defining Phase Operation
 - Phase splits
 - Dynamic splits
 - Maximum green

Phase Splits

- Concepts
 - Sum of green, yellow, and red clearance
 - Non-coordinated splits based on volume (average + random excess)
 - Allocate rest of cycle to coordinated phases

Phase Splits

- Guidelines
 - Handbook worksheet (p. 3-24)
 - Collect volume and lane count data
 - Allocate green time and compute splits (critical movement analysis)
 - Automated in TSCO

Example 5: Phase Splits

- Goals
 - 1) Determine the turn movement counts for an intersection
 - 2) Use these counts to compute reasonable evening peak-period phase splits
- Steps
 - 1) Collect intersection data
 - 2) Estimate the peak-period volume
 - 3) Compute phase splits

Example 5: Phase Splits

- Step 1: Collect Intersection Data
 - AADT
 - Major (E/W): 15,500 veh/d
 - Minor (N/S): 7,500 veh/d
 - Functional class
 - Major (E/W): arterial
 - Minor (N/S): arterial
 - Configuration
 - Major (E/W): 1 left-turn and 2 through lanes
 - Minor (N/S): 2 through lanes

Example 5: Phase Splits

- Step 1: Collect Intersection Data
 - Signal timing data
 - Phasing
 - Major (E/W) left-turn phase on each approach
 - Major (E/W) through phase on each approach
 - Minor (N/S) through phase on each approach
 - Cycle length: 80 s
 - Yellow + red clearance settings
 - All phases: 5 s
 - · Minimum green settings
 - Major (E/W) left-turn phase: 6 s
 - Major (E/W) through phase: 12 s
 - Minor (N/S) through phase: 14 s

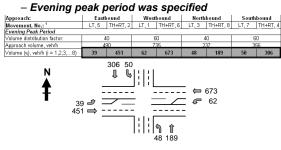

Example 5: Phase Splits

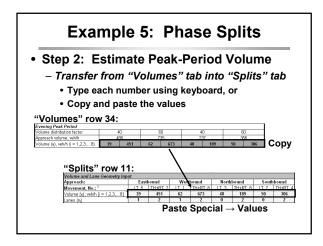

- Step 2: Estimate Peak-Period Volume
 - Same volume data from Example 2

Example 5: Phase Splits

- Step 2: Estimate Peak-Period Volume

Step 3: Compute Phase Splits - Yellow + red clearance settings • All phases: 5 s - Minimum green settings • Major (E/W) left-turn phase: 6 s • Major (E/W) through phase: 12 s • Minor (N/S) through phase: 14 s - Minor (N/S) through phase: 14 s - Minor (N/S) through phase: 15 s - Minor (N/S) through phase: 14 s - When the Malysis Period (7.0% to 9:00 am Northbound & Southbound Phasing Phase 2: Em | LT Phase & TH Phase | LT & TH III m same phase | Morthbound & Southbound Phasing Phase 2: LT & THHT, 2 | LT, 3 THHT, 3 | LT, 7 THHT, 4 | - Wollows and Lane Geometry Input | Approach: LT, 5 THHT, 2 | LT, 1 THHT, 6 | LT, 3 THHT, 6 | LT, 7 THHT, 4 | - Wallow + red clearance (Yi), s | 5 | 5 | 5 | 5 | 5 | 5 | 5 | - Minimum green (Sm, j, s | 6 | 12 | 6 | 12 | 14 | 14 | 14 | - Minimum green (Sm, j, s | 6 | 12 | 6 | 12 | 14 | 14 | 14 | - Minimum green (Sm, j, s | 6 | 12 | 6 | 12 | 14 | 14 | 14 | - Wallow + red clearance (Yi), s | 5 | 5 | 5 | 5 | 5 | 5 | - Minimum green (Sm, j, s | 6 | 12 | 6 | 12 | 14 | 14 | 14 | - Wallow + red clearance (Yi), s | 5 | 5 | 5 | 5 | 5 | 5 | - Minimum green (Sm, j, s | 6 | 12 | 6 | 12 | 14 | 14 | 14 | - Wallow + red clearance (Yi), s | 5 | 5 | 5 | 5 | 5 | - Minimum green (Sm, j, s | 6 | 12 | 6 | 12 | 14 | 14 | 14 | - Minor - Mino

Example 5: Phase Splits Step 3: Compute Phase Splits - Results from "Splits" worksheet - 63 percent of cycle available for phases 2 & 6 Volume and Lane Geometry Input - Approach: September 1.1.5 Septemb

50 s

19 s

Example 6: Phase Splits

Given

Equivalent ring structure

- AADTs, approach configurations, and phasing data for an intersection
- The Question
 - What phase splits should be used for each movement phase?

Example 6: Phase Splits

- The Data
 - Same data as for Example 5, except...
 - Phasing
 - Minor (N/S) left-turn phase on each approach
 - Cycle length: 70 s
 - Minor (N/S) left-turn lanes: 1 per approach
 - Minimum green settings:
 - Minor (N/S) left-turn phase: 6 s
- · Work for 5 minutes

Example 6: Phase Splits

Dynamic Splits

Concepts

- Controller automatically adjusts the phase splits on a cycle-by-cycle basis
- Takes time from a light non-coordinated phase (gapping out) to a heavier noncoordinated phase (being forced off)
- Works in coordinated mode
- Does not work if maximum recall is used
 - Lagging left-turn phases are often on maximum recall

Dynamic Splits

Concepts

Dynamic Splits

- Guidelines
 - Limited information on this setting
 - Research indicates benefits obtained when...
 - Left-turn phases lead the through phases
 - Traffic volumes vary significantly and unpredictably
 - May also be beneficial if resources limit the frequency of timing plan updates

Maximum Green

- Guidelines
 - Most controllers have the option to limit the split duration
 - Max 1
 - Max 2
 - Max inhibit
 - Maximum green is redundant to force off
 - Inhibit maximum green termination during coordinated operation
 - Maximum recall can still be used

Summary

- Chapter 3 Guidelines
 - Coordination potential
 - System settings
 - Phase settings
- Questions?

<u> </u>			

3. Signal Phasing & Operation

- Appendix A Guidelines
 - Left-turn operational mode
 - Left-turn phasing
 - Right-turn phasing
 - Pedestrian phasing

Left-Turn Operational Mode

- Concepts
 - Permissive
- Left-turn drivers yield to oncoming vehicles

- Left-turn drivers have right-of-way
- Protected-permissive
- · Left-turn drivers have a protected phase
- · They can also turn during green ball, after yielding to oncoming vehicles

Left-Turn Operational Mode

- Guidelines
 - Mode selection based on...
 - Left and opposing though volumes
 - Number of opposing through lanes
 - Cycle length
 - Opposing traffic speed
 - Sight distance
 - · Crash history

1	1
	. 1

Left-Turn Operational Mode

- Guidelines
 - Flow chart from Handbook p. A-9
 - 11 questions
 - Consider each approach separately
 - Automated in TSCO "Left-Turn Mode" worksheet

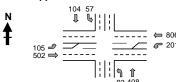

Example 7: Left-Turn Mode

- Goals
 - 1) Choose left-turn modes for each approach at an intersection
- Steps
 - 1) Collect intersection data
 - 2) Choose left-turn modes

Example 7: Left-Turn Mode

- Step 1: Collect Intersection Data
 - Cycle length: 100 s
 - Volume and lane geometry
 - All approaches have 2 through lanes
 - E/W approaches have 1 left-turn lane

Example 7: Left-Turn Mode

- Step 1: Collect Intersection Data
 - Crash history

Ī	Approach	EB	WB	NB	SB
ſ	Crashes	4	5	4	2

- Time period for crashes: 2 years
- Approach speeds
 - E/W: 45 mph
 - N/S: 35 mph
- Sight Distance
 - Adequate for left-turn drivers

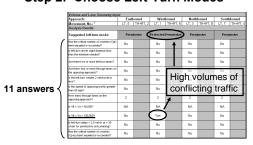

Example 7: Left-Turn Mode

- Step 2: Choose Left-Turn Modes
 - Enter input data
 - Verify volume, lane data
 - Enter crash history
 - Enter speed
 - Indicate whether sight distance is adequate

Eastl	ound	West	bound	North	bound	South	bound

Example 8: Left-Turn Mode

- Given
 - Volumes, lane counts, and operational data for an intersection
- The Question
 - What left-turn mode should be used for each intersection approach?

Example 8: Left-Turn Mode 306 50 • The Data ← 673 - Cycle length: 100 s **€** 62 - Crash history Ν Approach EB WB NB SB 4 5 4 2 - Time period for crashes: 2 years - Approach speed • E/W: 45 mph, N/S: 35 mph - Sight distance • E/W: 335 ft, N/S: 400 ft (compare with row 18 values) · Work for 5 minutes

Example 8: Left-Turn Mode

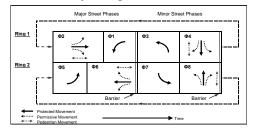

• The Answer

Left-Turn Phasing

- Concepts
 - Sequence of service provided to left-turn phases, relative to other phases
 - Options
 - Permissive-only (no left-turn phase)
 - Leading left-turn phase
 - Lagging left-turn phase
 - Split

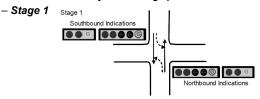

Left-Turn Phasing

- Concepts
 - Lead-lag phasing used for major street
 - Lead-lead phasing used for minor street

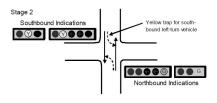

Left-Turn Phasing

- Concepts
 - Yellow trap
 - · Can occur with lead-lag or lag-lag sequence and protected-permissive mode
 - · Conflict between left-turn and oncoming vehicles at the end of the adjacent through phase

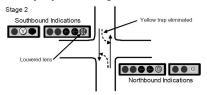

Left-Turn Phasing

- Concepts
 - Trap occurs to the left-turn movement adjacent to the first though phase that ends
 - Stage 2 change interval for southbound

Left-Turn Phasing

- Concepts
 - Dallas phasing solution to yellow trap problem
 - Green ball in left-turn head is assigned to an overlap with adjacent and opposing through phases
 - Use louvers to prevent this indication from being seen by adjacent through movement

• Concepts - Split phasing Major-Road Phases Minor-Road Phases Find 2 Protected Movement Permissive Movement Pedestrian Movement Pedestrian Movement

Left-Turn Phasing

- Guidelines
 - Lead-lead phasing
 - · Consistent with driver expectation
 - Minimizes conflict between left turn and through vehicles by...
 - Clears left-turn vehicles during initial protected phase, leaving few permissive left-turns
 - Clears left-turn vehicles that may have spilled back into through lanes before the through phase starts

Left-Turn Phasing

- Guidelines
 - Lag-lag phasing
 - Ensures both through phases start together
 - With protected-permissive mode...
 - Minimizes the need to call the left-turn phase
 - Reduces delay to left-turn movements that may arrive with the through platoon
 - Yellow trap problem can be created

Left-Turn Phasing

- Guidelines
 - Lead-lag phasing
 - Can improve progression
 - Can be used when leading left-turn phase serves left-turns from a shared lane
 - With protected-permissive mode...
 - Yellow trap can be a problem

Left-Turn Phasing

- Guidelines
 - Split phasing
 - · Less efficient than lead-lead, lead-lag, lag-lag
 - May be helpful if...
 - Travel paths of left-turns from opposing approaches cross within intersection
 - Left-turn and through must share a lane but leftturn phase is also required
 - Crash history of left-turn vehicles includes a large number of...
 - » Side swipe
 - » Head on

Right-Turn Phasing Concepts Typically using overlap with left-turn phase Major-Road Phases Minor-Road Phases Minor-Road Phases Minor-Road Phases Minor-Road Phases Minor-Road Phases Minor-Road Phases Ring 1 Protected Movement Permissive Movement Permissive Movement Permissive Movement Permissive Movement Permissive Movement

48

Right-Turn Phasing

- Guidelines
 - All of the following should be satisfied...
 - Exclusive right-turn lane is available
 - Right-turn volume is high (300 veh/h or more)
 - Left-turn phase is provided
 - U-turns are prohibited
 - Operational mode
 - If pedestrians are present, use protectedpermissive mode
 - If no pedestrians, use protected mode during both the left-turn and adjacent through phases

Pedestrian Phasing

- Concepts
 - Alternative pedestrian phasing
 - · Leading pedestrian walk
 - Concurrent with adjacent through movement phase
 - Lagging pedestrian walk
 - Concurrent with adjacent through movement phase
 - Exclusive
 - Additional phase for pedestrians

Pedestrian Phasing Vehicles WALK Pedestrian Clearance Time = Do/Vp Minimum Pedestrian Time Leading Walk Flashing DW Vehicular Green Vellow Red WALK Flashing DW Steady DW Steady DW

Pedestrian Phasing

- Guidelines
 - Leading pedestrian walk
 - Use where there are significant pedestrianvehicle conflicts
 - Lagging pedestrian walk
 - Use where the right-turn volume is high, and
 - There is an exclusive right-turn lane, or
 - The two streets serve one-way traffic
 - Exclusive
 - Use where there are high pedestrian volumes and significant conflicts with vehicles
 - Minimize impact to vehicle operation

Summary

- Appendix A Guidelines
 - Left-turn operational mode
 - Left-turn phasing
 - Right-turn phasing
 - Pedestrian phasing
- Questions?

4. Advanced Signal Timing Settings

- Appendix B Guidelines
 - Dynamic maximum green settings
 - Variable initial settings
 - Gap reduction settings
 - Phase-sequence-related settings
 - Rail preemption settings

Advanced Signal Timing Settings

- Overview
 - Often used when conditions are unusual
 - Have influence on safety or operations

	Primary Influence of Featur			
Feature	Operations	Safety		
Dynamic maximum	Yes			
Variable initial	Yes			
Gap reduction	Yes			
Phase-sequence settings	Yes	Yes		
Rail preemption		Yes		

Dynamic Maximum Green

- Concepts
 - Changes the maximum green in real time
 - Responds to phases that consistently maxout or gap-out
 - Responds in a gradual manner
 - User defined
 - Set on a phase-by-phase basis

152

Dynamic Maximum Green

- Concepts
 - Dynamic maximum limit
 - The boundary within which the green interval can be varied
 - Dynamic maximum step
 - Amount of time added or subtracted during each adjustment

• Concepts • Concepts Gapped out twice out twice Pyramic Max Limit out twice Over the control of the contr

Dynamic Maximum Green

Guidelines

- Use for phases serving movements that are...
 - · low-speed,
 - · not coordinated, and
 - unpredictable in terms of traffic volume level
 - Special events or incidents
- Operation is based on phase max-out
 - Not desirable for high-speed approaches
- If traffic demand is predictable, use settings by time-of-day

Dynamic Maximum Green

- Guidelines
 - Dynamic maximum limit
 - Larger than maximum green setting
 - Large enough to accommodate peak without creating damaging queues elsewhere
 - Dynamic maximum step
 - Relatively short
 - Balance between responsiveness and efficiency
 - Value of 5 to 10 s

Variable Initial Settings

Concepts

- Used to ensure that vehicles queued between the stop line and the nearest upstream detector are served
- Typical application
 - Through movement with one or more upstream detectors present
 - No stop bar detector present
- Settings
 - Added initial
 - Maximum initial

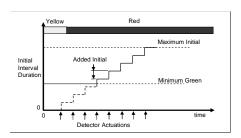

Variable Initial Settings

Concepts

- Computes the minimum green duration based on arrivals during red or yellow
- Added initial
 - Amount by which the variable initial time period increases for each vehicle actuation in yellow or red
- Maximum initial
 - Upper limit on the duration of variable initial timing period

Variable Initial Settings

Concepts

Added Initial

Guidelines	Right-turn on red significant	No right-turn on red
Number of	Added Initia	l, s/actuation
Detectors ¹	Minimum	Desirable
1	2.0	2.5
2	1.3	1.5
3	0.8	1.0
4	0.6	0.8
5	0.5	0.6
6 or more	0.4 0.5	

^{1 -} Total number of advance detectors associated with the subject phase

Maximum Initial

Guidelines

- Max. Initial (sec) = Distance (feet)/10

Distance between Stop Line and Nearest Upstream Detector, ft	Maximum Initial, s
151 to 175	17
176 to 200	19
201 to 225	21
226 to 250	23
251 to 275	25
276 to 300	27
301 to 325	29
326 to 350	31

Gap Reduction Settings

• Concepts

- Used to ensure queue clearance
- Typical applications
 - Phases serving high-volume movements
 - Provides queue clearance but less likely to extend to maximum green limit
 - Reduces delay to waiting movements
 - Phases serving high truck volumes
- Settings
 - Passage time
 - Time before reduction
 - Time to reduce
 - Minimum gap

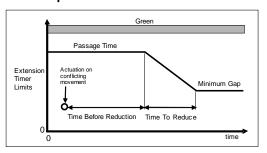

Gap Reduction Settings

• Concepts

- Reduces the extension time limit as the green interval duration increases
- Time before reduction
 - Initial portion of the green interval before the extension timer limit is reduced
- Time to reduce
 - Portion of the green interval during which the extension timer limit is reduced
- Minimum gap
 - Extension timer limit after the time-to-reduce period
 - Equal to the passage time setting

Gap Reduction Settings

Concepts

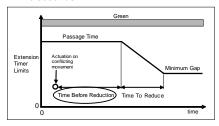

Passage Time

- Guidelines
 - Single advance detector
 - Use 3.5 s
 - Stop line detection
 - · See table below
 - Presence mode

Detection	85 th Percentile Speed, mph									
Zone	25	30	35	40	45					
Length, ft		Passage Time (<i>PT</i>), s								
20	3.0	3.0	3.0	3.5	3.5					
40	2.0	2.5	2.5	3.0	3.0					
60	1.5	2.0	2.5	2.5	2.5					
80	1.0	1.5	2.0	2.0	2.5					

Time Before Reduction

- Guidelines
 - Use the larger of...
 - Minimum green or maximum initial, and
 - 10 seconds

Time To Reduce

- Guidelines
 - Equal to one half of the difference between the minimum and maximum green settings
 - Equation TTR = $(G_{max} G_{min})/2$

	Minimum Time Before Reduction, s				Maxim	um Gr	een Se	tting, s		
			20	25	30	35	40	45	50	55
	Setting, s		Time To Reduce, s							
	5	10	8	10	13	15	18	20	23	25
	10	10	5	8	10	13	15	18	20	23
	15	15	n.a.	5	8	10	13	15	18	20
	20	20	n.a.	n.a.	5	8	10	13	15	18

Minimum Gap

- Guidelines
 - Presence mode
 - See table below
 - Steep upgrade and heavy vehicles
 - Increase by up to 1.0 second
 - Presence mode

Detection		85 th Percentile Speed, mph									
Zone	25	30	35	40	45	50	55	60	65	70	
Length, ft		Minimum Gap, s									
6	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	
20	1.0	1.0	1.0	1.5	1.5	1.5	1.5	1.5	1.5	1.5	
40	0.0	0.5	0.5	1.0	1.0	1.0	1.0	1.5	1.5	1.5	
60	0.0	0.0	0.5	0.5	0.5	1.0	1.0	1.0	1.0	1.0	
80	0.0	0.0	0.0	0.0	0.5	0.5	0.5	1.0	1.0	1.0	

Phase-Sequence Settings

- Conditional Service
 - Allow a previous phase in the ring to be serviced under certain conditions
 - Sometimes used for left-turn phases
- Simultaneous Gap-Out
 - Ensures that active phases in both rings are in agreement to terminate (gap-out, max-out, etc.)
 - Typically used for all phases ending at barrier
- Dual Entry
 - Ensures one phase in each ring served even if only one is called
 - Typically used for through movement phases

Rail Preemption Settings

- Settings
 - Right-of-way transfer
 - · Priority status
 - · Preempt delay
 - Preempt memory
 - Preempt minimum green and walk
 - Preempt pedestrian change
 - Track clear
 - Track clear phases
 - Track green
 - Dwell phases
 - Exit phases

Rail Preemption Settings

- Primary Guidebook
 - Guide for Determining Time Requirements for Traffic Signal Preemption at Highway-Rail Grade Crossings (TxDOT 2003)
 - (also known as Preemption Worksheet)

	Texas Department of Transportation DE FOR DETERMINING TIME REQUIREMENTS FO NAL PREEMPTION AT HIGHWAY-RAIL GRADE C	
Cey	Date	
County	Completed by	
District	District Approval	
	Cossing Steel	Parallel Street Name
Show North Arrow	Traffic Rignar Care Pacader Street	Crossing Street Name
	Plantogs X Warning Device	
Rairond	Ratioad Contact	
Crossing DOT#	Phone	

Right-of-Way Transfer

- Concepts
 - Priority status
 - · Several preempts available
 - Priority determines which is used if several are called at the same time
 - Preempt delay
 - Time lag between detection and call for preempt
 - Preempt memory
 - With memory "on", a detection is retained after it is received and regardless if it subsequently dropped

Right-of-Way Transfer

- Concepts
 - Minimum green and minimum walk
 - Minimum length of the green interval of phase that is active prior to preempt
 - Pedestrian change
 - Minimum length of time provided for pedestrian change interval of a phase that is active prior to preempt
 - Follows the walk interval

Right-of-Way Transfer

- Guidelines
 - Priority status
 - · Rail is assigned to Preempt 1
 - In special cases two preempts are used
 - Preempt delay
 - Normally 0.0 s
 - Some delay may be needed where rail switching occurs
 - Preempt memory
 - Should be operated with memory "on"
 - Exceptions
 - Phantom preempt calls occur
 - Multiple tracks with multiple preempts

Right-of-Way Transfer

Guidelines

- Minimum green and minimum walk
 - Should not be set to less than 2.0 s
 - A value less than 2.0 s may be used if needed to satisfy warning time requirements

- Pedestrian change

- Provide normal change interval if possible
- TMUTCD permits truncation of this interval if needed to ensure preemption time does not exceed warning time
- · Check the truncation exposure for peds

Track Clear

Concepts

- Track clear phases
 - Phases that serve vehicles queued over the tracks during preempt sequence
- Track green
 - Duration of green interval for track clear phase

Track Clear

Guidelines

- Track clear phases
 - Green indication should always be used
 - Flashing red or yellow is not recommended

- Track green

- Minimum duration is equal to the queue clearance time
- Desirable duration is equal to APT + 15 s
 - This duration will avoid a preempt trap

Dwell and Exit Phases

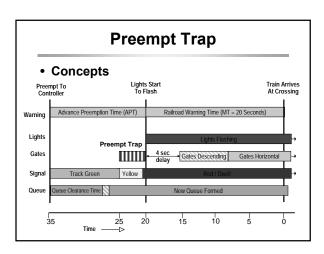

- Concepts
 - Dwell phases
 - Follows the track clear phases
 - Cycles through phases that do not conflict with railroad crossing
 - Exit phases
 - · Phases that are active during the exit period
 - One phase per ring

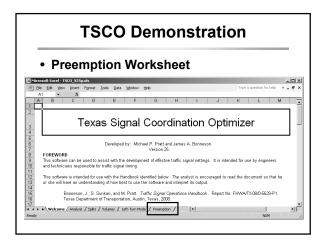

Dwell and Exit Phases

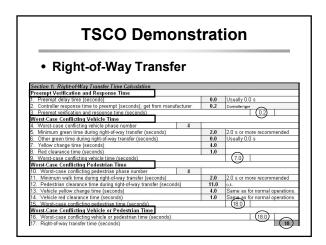

- Guidelines
 - Dwell phases
 - All phases serving movements not blocked by the train
 - All dwell phases should be served in sequence during dwell period
 - Signal operation in flash mode is not recommended
 - Exit phases
 - Typically the phases held in red (omitted) while the train is present

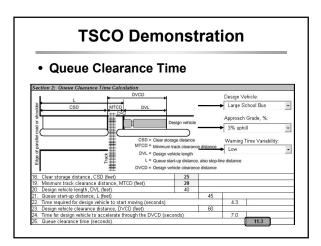

Preempt Trap

- Concepts
 - Characteristics
 - Train arrives when controller is serving the track clear phase
 - Right-of-way transfer time is short
 - Track clear phase ends before the gates go down
 - More likely to occur with advance preemption time

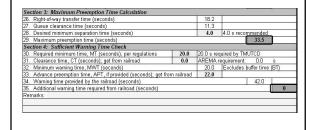

TSCO Demonstration

- Maximum Preemption Time
- Warning Time Check

TSCO Demonstration

- Track Clearance Green Time
 - Desirable track green duration (optional)

Section 5: Track Clearance Green Time Calculation (Optiona	I)				
Preempt Trap Check					
36. Advance preemption time, APT (seconds)	22.0	Typically	, same value	as in Line	33.
37. Multiplier for maximum APT due to train handling	1.25	(based or	n entry in J5	1)	
Estimated maximum APT (seconds)					
BB. Maximum APT (seconds)	May use e	stimate in	row abov		
39. Minimum duration for the track clearance green interval (seconds) 15.0				T. 15 s or m	ore require
40. Gates down after start of preemption (seconds)					
11. Preempt verification and response time (seconds)					
42. Best-case conflicting vehicle or pedestrian time (seconds) 0.0				0 s	
43. Minimum right-of-way transfer time (seconds)		-	0.2		
14. Minimum track clearance green time (seconds)				42.3	
Clearing of Clear Storage Distance				01	•
45. Time required for design vehicle to start moving (seconds)	200	- P	4.3		
46. Design vehicle clearance distance, DVCD (feet)	60				
7. Portion of CSD to clear during track clearance phase (feet)	25	CSD* in Fig	ure 3 (see bek	ow); sugges	t using CSE
48. Design vehicle relocation distance, DVRD (feet)		85			
49. Time required for design vehicle to accelerate through DVRD	(seconds)	10	8.5		
D. Time to clear portion of clear storage distance (seconds)			*	12.8	
1. Track clearance green interval (seconds)					43

TSCO Demonstration • Vehicle-Gate Interaction Check - Minimum APT time to prevent gate from striking design vehicle - Compare result to APT (row 33)

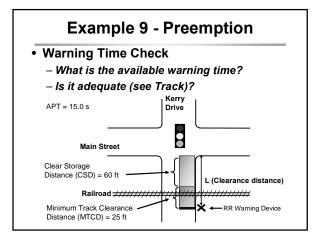

- - If less than APT, no problem
 - · If greater than APT, gate strikes vehicle

52. Right-of-way transfer time (seconds)		18.2		
53. Time required for design vehicle to start moving (seconds)		4.3		
54. Time required for design vehicle to accelerate through DVL (seconds)	5.6		00	
55. Time required for design vehicle to clear descending gate (seconds)		- 10	28.1	
56. Duration of flashing lights before gate descent start (seconds); get from I	ailroad	4.0	Typical: 3	to 5 s
57. Full gate descent time (seconds); get from railroad	7.5	Typical: 6.5 to 8.5 s		
Distance from center of gate support post to nearest side of design vehicle, d (feet)	12.0	Figure 4 (see below)	
58. Proportion of non-interaction gate descent time	0.50			
59. Non-interaction gate descent time (seconds)		3.8	1	
60. Time available for design vehicle to clear descending gate (seconds)			7.8	
61. Advance preemption time (APT) required to avoid design vehicle-gate into	eraction (s	econds)		21

Example 9 - Preemption

- Goals
 - Evaluate preemptions scenarios for an atgrade intersection
- Steps
 - Collect information
 - Geometry
 - Phasing
 - Enter all data in the worksheet

Example 9 - Preemption • Right-of-Way Transfer - What is the pedestrian change interval (PCI)? - What is the right-of-way transfer time? Yellow – 4 seconds All-Red – 1 second $\begin{array}{l} \text{Track phase} - 3 \\ \text{Dwell phases} - 2, 5, 6 \\ \text{Exit phase} - 3 \end{array}$ PCI = Dc/Vp - (Y + Rc) Walking speed = 4 fps Railroad /////////

Example 9 - Preemption • Track Clearance Green Time

- Preempt trap check
 - What is the minimum track clearance green time?
 - Does the green extend beyond "gate down"?
- Clearing of clear storage distance
 - What is the time to clear the clear storage distance?
- Vehicle-Gate Interaction Check
 - Distance from gate to vehicle (d) = 12 ft
 - What APT is needed to avoid vehicle-gate interaction?

Summary

- Appendix B Guidelines
 - Dynamic maximum green settings
 - Variable initial settings
 - Gap reduction settings
 - Phase-sequence-related settings
 - Rail preemption settings
- Questions?

5. Detection Design & Operation

- Appendix C Concepts
 - Indecision zone
 - Detection-related control settings
- Appendix C Guidelines
 - Loop detection layout for low speeds
 - Loop detection layout for high speeds
 - Video detection design
 - Video detection layout for low speeds

• Concepts - Indecision zone location Probable Stop Indecision Zone Probable Go Dbz = Distance to the beginning of the indecision zone Dez = Distance to the end of the indecision zone

Indecision Zone

Concepts

- Beginning of zone
 - 5.5 seconds of travel time from the stop line
 - 90th percentile driver
- End of zone
 - 2.5 seconds of travel time from the stop line
 - 10th percentile driver
- Exists every cycle after the onset of yellow
- Advance detection
 - Used to minimize instances where vehicles are caught in indecision zone at yellow onset

Detection-Related Settings

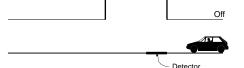

Concepts

- Controller memory
 - Locking
 - Actuations received on yellow or red are kept until served
 - Used for phases served by advance detection and no recall
 - Nonlocking
 - Actuations are dropped as soon as vehicle leaves the detector
 - Most appropriate for phases served by <u>stop line</u> <u>detection</u>

Detection-Related Settings

Concepts

- Detection mode
 - Presence mode
 - Detector on when vehicle enters detection zone
 - Detector off when vehicle leaves detection zone
 - Typically used with nonlocking memory

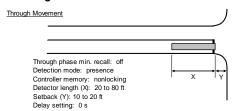

Detection-Related Settings Concepts Detection mode Pulse mode Detector on when vehicle enters detection zone Pulse immediately turns "off" Not typically used for signal control

Loop Layout for Low Speeds

- Guidelines
 - 85th percentile speed of 40 mph or less
 - Objectives
 - Inform the controller of waiting traffic
 - Serve the queue in each phase
 - Detector location
 - Near stop line
 - Applicable movements
 - Through
 - Left turn
 - Right turn

Loop Layout for Low Speeds

- Guidelines
 - Detection length
 - Longer lengths provide better information
 - Through movement

Loop Layout for Low Speeds • Guidelines - Left-turn movement - Protected or protected-permissive Left-Turn Movement: Protected or Protected-Permissive Mode

Detector length (X): 20 to 80 ft
Setback (Y): 10 to 20 ft
Delay setting: 0 s (desirably, 5 to 12 s if prot-perm. mode)

Adjacent through phase min. recall: off or on

Detection mode: presence Controller memory: nonlocking

• Guidelines - Left-turn movement - Permissive-only Left-Turn Movement: Permissive-Only Mode Adjacent through phase min. recall: off Detection mode: presence Controller memory: nonlocking Detector length (X): 20 to 80 ft Setback (Y): 5 to 10 ft Delay setting: 0 s

Loop Layout for High Speeds

- Guidelines
 - 85th percentile speed of 45 mph or more
 - Objectives
 - Inform the controller of waiting traffic
 - Serve the queue in each phase
 - Provide safe termination of green interval
 - Detector location
 - In advance of intersection
 - May be combined with stop line detection
 - Applicable movements
 - Through

• Guidelines - Detection options - Option 1 • Advance detection and stop line detection • Stop line detection disabled after queue clears - Option 2 • Advance detection only • Need to use locking or recall features - Option 3 • Advance detection and stop line detection

Loop Layout for High Speeds

- Guidelines
 - Option 1
 - Most effective
 - Requires one lead-in for advance detection
 - Requires one lead-in for stop line detection
 - Option 2
 - No stop line detection to maintain
 - Delay may be higher

• Stop line detection always on

- Option 3
 - Used when stop line and advance detection use common lead-in
 - Least effective

Loop Layout for High Speeds

- Guidelines
 - Advance detectors are 6 ft in length

Category	85 th Percentile	Design Element	Design Values by Detectio Option		Detection	
	Speed, mph		Option 1	Option 2	Option 3	
Detection	70	Distance from the stop line		600, 475, 3	50	
layout	65	to the upstream edge of the		540, 430, 32	20	
	60	advance detector, ft	475, 375, 275			
	55		415, 320, 225			
	50		350, 220			
	45		330, 210			
	45 to 70	Stop line detection zone length, ft	40	not used	40	
	45 to 70	Advance detection lead-ins wired to channel separate from stop line detection	Yes	not used	Not necessary	

Loop Layout for High Speeds

Guidelines

- Controller settings

Category	85 th Percentile	Design Element	Design Values by Detection		Detection
	Speed, mph		Option 1	Option 2	Option 3
Controller	70	Passage time, s	1.4 to 2.0	1.4 to 2.0	1.0 to 1.2
settings	65		1.6 to 2.0	1.6 to 2.0	1.0 to 1.2
	60		1.6 to 2.0	1.6 to 2.0	1.0 to 1.2
	55		1.4 to 2.0	1.4 to 2.0	1.0 to 1.2
	50		2.0	2.0	1.4 to 1.6
	45		2.0	2.0	1.4 to 1.6
	45 to 70	Detection mode	Presence	Presence	Presence
	45 to 70	Controller memory	Nonlocking	Varies	Nonlocking
	45 to 70	Stop line detection channel extend setting, s	2.0	not used	1.0
	45 to 70	Stop line detection operation	Deactivate after gap- out	not used	Contin- uously active

Video Detection Design

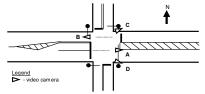

Guidelines

- Camera location
 - Camera offset
 - Camera height
- Field-of-view calibration
- Application
 - Low-speed movements
 - Other detection systems may be better suited to advance detection for high-speed movements

Video Detection Design

Guidelines

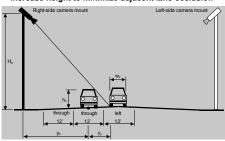

- Camera offset
 - When mast arms are used to support the signal heads, location A or B is recommended
 - It eliminates adjacent lane occlusion
 - When span wire is used, location C or D is recommended
 - Tall vehicles may place unneeded calls

Video Detection Design Guidelines

- Camera height

Increase height to minimize adjacent lane occlusion

Video Detection Design

Guidelines

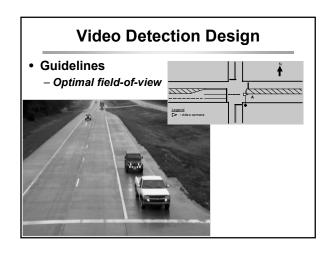

Legend M = mast arm P = strain pole R = 5 ft riser

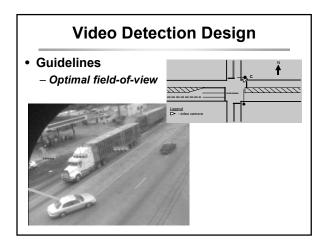

- Camera height
 - Minimum heights to reduce occlusion

		45							

Video Detection Design

- Guidelines
 - Field-of-view calibration
 - · Stop line should be...
 - Parallel to the bottom edge of the view
 - In the bottom one-third of the view
 - Include all approach traffic lanes and one departing lane
 - Approach width at the stop line is...
 - 90 percent of the horizontal width for head-on view
 - 40 to 60 percent for offset view
 - View must exclude horizon

Video Detection Design

- Guidelines
 - Field-of-view
 - Adjustments to minimize sun glare
 - Use a visor
 - Tilt the camera downward
 - Minimum pitch of 3 degrees from the horizontal
 - · Adjustments to minimize lighting glare
 - Avoid bright lights in the evening hours
 - Avoid lights that flash or vary in intensity
 - Use a video recorder to check nighttime operation

١	/ideo	Detection	Layout
---	-------	------------------	--------

 - Detector location
 - Near stop line
 - Applicable movements
 - Through
 - Left turn
 - Right turn

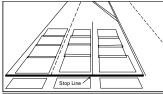

Video Detection Layout

- Guidelines
 - Detection zone location and length
 - Detection mode and settings

Video Detection Layout

- Guidelines
 - Detection zone location
 - Typically use several detectors in zone
 - Locate one zone beyond stop line

Rule-of-Thumb: The detection zone should consist of one or more detectors, with each detector about the size of a car. Detectors may be overlapping. Those beyond the stop line also detect headlights.

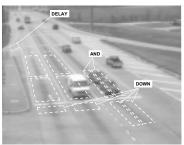

Video Detection Layout

- Guidelines
 - Detection zone length
 - Use passage time of 0.0 s
 - Use zone length (in ft) = 3×85^{th} % speed in mph

85 th	Distance between		Camera Height, ft				
Percentile	Camera	20	24	28	32

6. Diamond Interchange Operations

- Appendix D Concepts
- Appendix D Guidelines

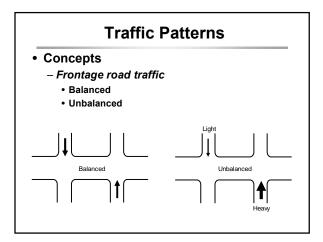

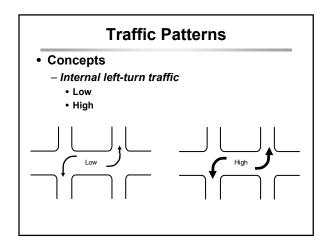

Diamond Interchange Operations

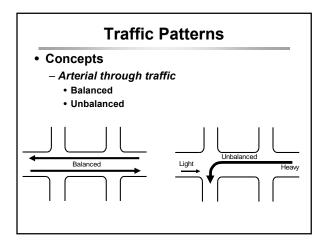

- Concepts
 - Interchange spacing
 - Traffic patterns
 - Types of traffic signal control
 - Phase sequence
 - Conditional service

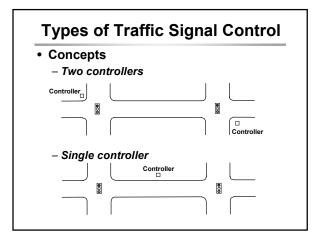

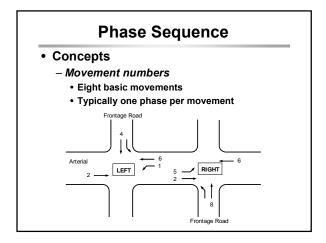

Interchange Spacing Concepts - Three interchange spacing categories Interchange Category Spacing Narrow < 400 ft Intermediate 400 to 800 ft Wide > 800 ft

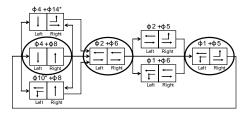

Phase Sequence

- Concepts
 - Three phase
 - Four phase
 - Separate intersection
 - Two-phase

Phase Sequence

- Concepts
 - Three-phase sequence
 - Frontage road phases start and end together
 - Arterial lefts lag (usually)

Phase Sequence

- Concepts
 - Three-phase characteristics
 - Arterial through traffic typically has good progression through the interchange
 - Can have coordination with adjacent signals
 - Adequate interior storage is needed when serving frontage road phases
 - Frontage road volumes should be reasonably balanced

Phase Sequence

- Concepts
 - Four-phase sequence
 - Four external phases
 - Each external movement served in sequence
 - Includes two fixed transition intervals

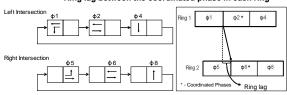

Phase Sequence

- Concepts
 - Four-phase characteristics
 - Arterial traffic has good progression through the interchange
 - Coordination with adjacent signals is difficult
 - External phases are fully actuated
 - Can adjust to variations in traffic demand
 - Internal movements always clear the interior of the interchange
 - Two transition intervals improve throughput during high-volume conditions
 - Can be inefficient during low-volume conditions

Phase Sequence

- Concepts
 - Separate intersection sequence
 - Assigns one ring to control each intersection
 - Coordination is achieved by specifying
 - Common cycle length for each ring
 - Ring lag between the coordinated phase in each ring

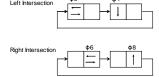

Phase Sequence

- Concepts
 - Separate intersection characteristics
 - Offers some flexibility in phasing that was available with two controllers
 - Uses only lead-lead phasing sequence
 - · Can operate fully actuated
 - Each ring fully actuated and isolated
 - Can be used to provide good coordination between the two intersections

Phase Sequence

- Concepts
 - Two-phase sequence
 - Assigns one ring to control each intersection
 - · Omits the internal left-turn phases
 - These left-turn movements are served permissively

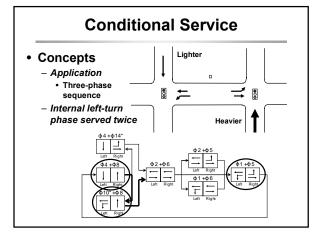

Phase Sequence

- Concepts
 - Two-phase characteristics
 - Used at locations with protected-permissive internal left-turn phases
 - Can reduce the delay for all major movements
 - Most effective when...
 - Interior left turn movements are very light
 - Overall volumes are low (e.g., nighttime)
 - Implemented after placing the controller in the separate intersection

Conditional Service

- Concepts
 - Controller will invoke if...
 - Conditional service is enabled
 - One of the frontage road phases gaps out
 - There is a call on the internal left-turn phase
 - There is sufficient time to serve the minimum green of the internal left-turn phase

Diamond Interchange Operations

- Appendix D Guidelines
 - Selection of phase sequence
 - Actuated phase settings
 - Loop detection layout for low speeds
 - Loop detection layout for high speeds
 - Configuration of video detection outputs
 - Conditional service

Selection of Phase Sequence

- Guidelines
 - Selection of phase sequence
 - Narrow interchanges (< 400 ft)

Interchange Spacing	Arterial Through Traffic Volume	Frontage Road Traffic Pattern	Internal Left- Turn Traffic Volume	Typical Phase Sequence
Less than 400 ft	Unbalanced	Balanced	Low	Four
(narrow)			High	
		Unbalanced	Low	
			High	
	Balanced	Balanced	Low	Four or three
			High	Four
		Unbalanced	Low	Four or three
			High	Four

Selection of Phase Sequence

- Guidelines
 - Selection of phase sequence
 - Intermediate interchanges (400 ft to 800 ft)

Interchange Spacing	Arterial Through Traffic Volume	Frontage Road Traffic Pattern	Internal Left- Turn Traffic Volume	Typical Phase Sequence
Between 400	Unbalanced	Balanced	Low	Three
and 800 ft			High	Three or separate
(intermediate)		Unbalanced	Low	Separate
			High	
	Balanced	Balanced	Low	Three
			High	
		Unbalanced	Low	Separate
			High	Three or separate

Selection of Phase Sequence

- Guidelines
 - Selection of phase sequence
 - Wide interchanges (> 800 ft)

Interchange Spacing	Arterial Through Traffic Volume	Frontage Road Traffic Pattern	Internal Left- Turn Traffic Volume	Typical Phase Sequence
More than	Unbalanced	Balanced	Low	Three
800 ft			High	Separate
(wide)		Unbalanced	Low	Separate
			High	
	Balanced	Balanced	Low	Three
			High	
		Unbalanced	Low	Separate
			High	

Actuated Phase Settings

- Guidelines
 - Minimum green
 - Maximum green

Minimum Green

- Guidelines
 - Except as noted, minimum green is based on guidelines provided in Chapter 2
 - Driver expectancy
 - Pedestrian crossing time

Minimum Green

- Guidelines
 - Three-phase sequence
 - Phase 2 and 6 minimum green
 - Need to ensure that a vehicle starting on the arterial approach is not stopped in the interior

Spacing,	Travel	Minimu	ım Gree	n for Ph	ase 1, s	Minimum Green for Phase 5, s			
ft	Time	5	6	7	8	5	6	7	8
	(<i>T</i>), s	Minimu	Minimum Green for Phase 2, s			Minimum Green for Phase 6,			
400	15	5	5	5	5	5	5	5	5
500	17	7	6	5	5	7	6	5	5
600	19	9	8	7	6	9	8	7	6

1000	28	18	17	16	15	18	17	16	15

Minimum Green

- Guidelines
 - Four-phase sequence
 - Phases 2, 4, 6, 8, 12, and 16 minimum green should equal the larger of...
 - Min. green based on driver expectancy
 - Min. green based on pedestrian crossing time
 - Travel time within the interchange

Interchange Spacing, ft	Travel Time (T), s	Minimum Green for Phases 2 and 6, s	Minimum Green for Phases 4 and 8, s	Minimum Green for Phases 12 and 16, s
100	7	9	5	2
200	10	15	7	3
300	12	20	9	5
400	15	24	12	8

Maximum Green

- Guidelines
 - Except as noted, maximum green is based on guidelines provided in Chapter 2
 - Volume
 - Movement (turn or through)
 - Speed
 - Minimum green setting

Maximum Green

- Guidelines
 - Three-phase sequence
 - Phase 1 and 5 max. based on travel time
 - Phase 4 and 8 based on internal storage
 - Phase 10 max. = phase 10 min. (same for 14)

l	Interchange Spacing (S), ft	Travel Time (T), s	Maximum Green for Phases 1 and 5, s	Maximum Green for Phases 4 and 8, s
l	400	15	15	34
l	500	17	17	42
l	600	19	19	50
l	700	21	21	58
ı	800	24	24	66
l	900	26	26	74
ı	1000	28	28	82

_				
_				
_				
_				
_				
_				
_				
_				

Maximum Green

- Guidelines
 - Four-phase sequence
 - Phase 12 max. green = phase 12 min. green
 - Phase 16 max. green = phase 16 min. green

Loop Detection for Low Speeds

- Guidelines
 - 85th percentile speed of 40 mph or less
 - Use both stop line and advance detectors
 - Detector channel numbers

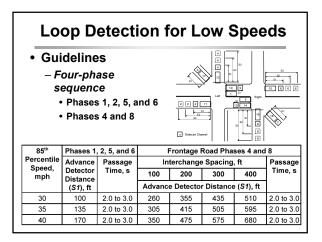

Loop Detection for Low Speeds

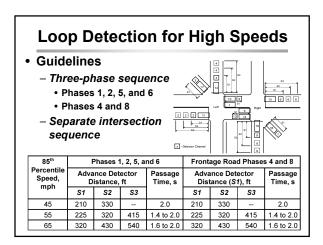

- Guidelines
 - Three-phase sequence
 - Phases 1, 2, 5, and 6
 - Phases 4 and 8
 - Separate intersection sequence

e	4 3 50 50 50 50 50 50 50

40	170	2.0 to 3.0	170	2.0 to 3.0

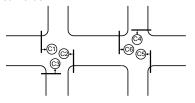

Guidelines - 85th percentile speed of 45 mph or more Use both stop line and advance detectors Detector channel numbers

Loop Detection for High Speeds Guidelines - Four-phase sequence • Phases 1, 2, 5, and 6 • Phases 4 and 8 85th Phases 1, 2, 5, and 6 Frontage Road Phases 4 and 8 Passage Interchange Spacing, ft Time, s 100 200 300 Time, s Advance Detector 100 200 300 mph S3 Advance Detector Distance (S1), ft S2 45 210 330 2.0 390 535 650 2.0 to 3.0 225 320 415 1.4 to 2.0 480 650 700 2.0 to 3.0 320 430 540 1.6 to 2.0 565 700 700 2.0 to 3.0

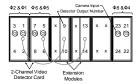

Video Detection Design

- Guidelines
 - Typically use six cameras
 - Three per intersection
 - High-speed approaches may use multiple cameras

Video Detection Design

- Guidelines
 - Typically use two channel detector cards
 - Single-channel and four-channel cards are also occasionally used
 - Use detector configuration meeting TxDOT specification

Video Detection Design

Guidelines

- Typical video detector switching

Camera Number	Detector Output Number	Phase Number	Assigned Detector Channel	<u> </u>

Conditional Service

Guidelines

- Conditional service can be used when...
 - · Three-phase operation is used
 - The difference between the average green interval of the two frontage roads exceeds 10 to 12 s
 - Minimum green for phases 10 and 14 is short
 Typically 5 to 8 s
- Decision to use conditional service
 - Based on consideration of frontage road volume
 - Volume must be very unbalanced or additional delay may be incurred by arterial movements

Summary

- Appendix D Guidelines
 - Selection of phase sequence
 - Actuated phase settings
 - Loop detection layout for low speeds
 - Loop detection layout for high speeds
 - Configuration of video detection outputs
 - Conditional service
- Questions?

Wrap-Up

- Questions or Comments?
- A Request
 - Please fill out the course review form
 - Training course coordinators
 - Return course evaluations and sign-in sheets to Henry Wickes in TRF
- Thank You!

EXAMPLE 1: MAXIMUM GREEN

Location: 4-leg signalized intersection	· · · · · · · · · · · · · · · · · · ·	
INPUT DATA		
General Information		
Phase 2 direction: Eastbound		
Roadway	Major	Minor
Direction	East/West	North/South
Functional classification	Arterial	Collector
Morning and noon peak demand direction	Eastbound	Northbound
Average annual daily traffic (AADT), veh/d	10,000	5,000
Through lanes on major-road approaches: 2 (ea Signal Timing Data Major-road minimum green setting: 10 s (easth		
What is the peak-period volume (veh/h)?		
What is the peak-period volume (veh/h/ln)?		
The maximum green setting is the larger of:		
1) 30 s		
2) Minimum green setting + 10 s =	s + 10 s =	S
3) $^{1}/_{10}$ of the peak-period volume = $^{1}/_{10}$ x	=	s
OUTPUT SUMMARY		
What is the maximum green setting (s)?		

EXAMPLE 2: MAXIMUM GREEN

Location: 4-leg signalized intersection

INPUT DATA

General Information

Phase 2 direction: Eastbound

Roadway	Major	Minor
Direction	East/West	North/South
Functional classification	Arterial	Arterial
Morning and noon peak demand direction	Eastbound	Northbound
Average annual daily traffic (AADT), veh/d	15,500	7,500

Approach Configuration Data

Movements existing: Left-turn, through, and right-turn (all approaches) Through lanes on major-road approaches: 2 (eastbound and westbound)

Signal Timing Data

Phase	Minimum green setting, s
Major left-turn	6
Major through	12
Minor through	14

CALCULATIONS

Movement	Peak-period	Peak-period	Minimum	Maxin	num green set	ting, s,
phase	volume, veh/h	volume,	green		based on	
		veh/h/ln	setting, s	Shortest	Min green	Volume
Major			12	30		
through			12	30		
Minor			14	20		
through			14	20		
Major			6	15		
left-turn			6	13		

OUTPUT SUMMARY

What is the maximum green setting (s)? Major through	
What is the maximum green setting (s)? Minor through	
What is the maximum green setting (s)? Major left-turn	

EXAMPLE 3: OFFSETS

Location: 4-leg signalized intersection

INPUT DATA

General Information

Cycle length range: 60 to 80 s Phase 2 direction: Eastbound

Signal Timing Data

u rumng	Data				
Phase	Intersection	1	3	5	9
	Distance coordinate (x), ft	0	2260	3950	7740
	Offset, s	0	55	6	0
1	Phase split, % of cycle	12	33	18	15
	Yellow + red clear, s	4	4	4	4
	Phase sequence	Lead	Lead	Lead	Lag
2	Phase split, % of cycle	52	30	44	41
	Yellow + red clear, s	6	4	6	6
5	Phase split, % of cycle	20	30	12	14
	Yellow + red clear, s	3	4	3	3
	Phase sequence	Lead	Lag	Lag	Lead
6	Phase split, % of cycle	44	33	50	42
	Yellow + red clear, s	6	4	6	6

Segment Data

Progression speed: 40 mph (segments A, C, E, and I)

OUTPUT SUMMARY

What is the optimal cycle length (s)?	
What are the optimal offsets (s)? Intersection 1:	
Intersection 3:	
Intersection 5:	
Intersection 9:	
What is the progression bandwidth associated with this timing plan?	

EXAMPLE 4: OFFSETS

Location: 4-leg signalized intersection

INPUT DATA

General Information

Cycle length: 70 s

Phase 2 direction: Eastbound

Signal Timing Data

ai timing	Data					
Phase	Intersection	1	3	5	7	9
	Distance coordinate (x), ft	0	2260	3950	*	7740
	Offset, s	0	55	6	30	0
1	Phase split, % of cycle	12	33	18	15	15
	Yellow + red clear, s	4	4	4	4	4
	Phase sequence	Lead	Lead	Lead	Lag	Lag
2	Phase split, % of cycle	52	30	44	44	41
	Yellow + red clear, s	6	4	6	6	6
5	Phase split, % of cycle	20	30	12	15	14
	Yellow + red clear, s	3	4	3	3	3
	Phase sequence	Lead	Lag	Lag	Lead	Lead
6	Phase split, % of cycle	44	33	50	44	42
	Yellow + red clear, s	6	4	6	6	6

^{*} The distance coordinate (x) for intersection 7 is 4,800 ft for alternative 1 and 5,200 ft for alternative 2.

Segment Data

Progression speed: 40 mph (segments A, C, E, G, and I)

OUTPUT SUMMARY

What is the optimal offset (s)?	Alternative 1:	
	Alternative 2:	
What is the bandwidth (s)?	Alternative 1:	
	Alternative 2:	
Which alternative is better?		

EXAMPLE 5: PHASE SPLITS

Location: 4-leg signalized intersection

INPUT DATA

General Information

Cycle length: 80 s

Phase 2 direction: Eastbound

East/west road phasing: Left-turn phase and through phase

North/south road phasing: Left-turns and through movements in same phase

Roadway	Major	Minor
Direction	East/West	North/South
Functional classification	Arterial	Arterial
Morning and noon peak demand direction	Eastbound	Northbound
Average annual daily traffic (AADT), veh/d	15,500	7,500

Volume and Lane Geometry Input Data

Approach	Eastbound		Westbound		Northbound		Southbound	
Movement	Left	Thru	Left	Thru	Left	Thru	Left	Thru
Volume, veh/h	39	451	62	673	48	189	50	306
Lanes	1	2	1	2	0	2	0	2

Change Period and Minimum Green Data

Yellow + red clearance: 5 s (all phases)

Phase	Minimum green setting, s
Major left-turn	6
Major through	12
Minor through	14

OUTPUT SUMMARY

What phase splits should be used?

Approach	Eastbound		Westbound		Northbound		Southbound	
Movement	Left	Thru	Left	Thru	Left	Thru	Left	Thru
Phase split, s								
Phase split, percent of cycle								

EXAMPLE 6: PHASE SPLITS

Location: 4-leg signalized intersection

INPUT DATA

General Information

Cycle length: 70 s

Phase 2 direction: Eastbound

East/west road phasing: Left-turn phase and through phase North/south road phasing: Left-turn phase and through phase

Roadway	Major	Minor
Direction	East/West	North/South
Functional classification	Arterial	Arterial
Morning and noon peak demand direction	Eastbound	Northbound
Average annual daily traffic (AADT), veh/d	15,500	7,500

Volume and Lane Geometry Input Data

Approach	Eastbound		Westbound		Northbound		Southbound	
Movement	Left	Thru	Left	Thru	Left	Thru	Left	Thru
Volume, veh/h	39	451	62	673	48	189	50	306
Lanes	1	2	1	2	1	2	1	2

Change Period and Minimum Green Data

Yellow + red clearance: 5 s (all phases)

Phase	Minimum green setting, s
Major through	12
Minor through	14
Major left-turn	6
Minor left-turn	6

OUTPUT SUMMARY

What phase splits should be used?

Approach	Eastbo	Eastbound		Westbound		Northbound		Southbound	
Movement	Left	Thru	Left	Thru	Left	Thru	Left	Thru	
Phase split, s									
Phase split, percent of cycle									

EXAMPLE 7: LEFT-TURN MODE

Location: 4-leg signalized intersection

INPUT DATA

General Information

Cycle length: 100 s

Phase 2 direction: Eastbound

Volume and Lane Geometry Input Data

Approach	Eastbound		Westbound		Northbound		Southbound	
Movement	Left	Thru	Left	Thru	Left	Thru	Left	Thru
Volume, veh/h	105	502	201	806	93	408	57	104
Lanes	1	2	1	2	0	2	0	2

Crash History Data

Approach Eastbound		Westbound	Northbound	Southbound	
Left-turn crashes	4	5	4	2	

Time period for crashes: 2 years

Speed and Sight Distance Data

Major-road approach speed: 45 mph (eastbound and westbound) Minor-road approach speed: 35 mph (northbound and southbound)

Sight distance: Adequate for all left-turn movements

OUTPUT SUMMARY

What is the suggested left-turn mode? (circle one)

Approach	Eastbound	Westbound	Northbound	Southbound
	Protected-only	Protected-only	Protected-only	Protected-only
Left-turn mode	Protected- permissive	Protected- permissive	Protected- permissive	Protected- permissive
	Permissive	Permissive	Permissive	Permissive

EXAMPLE 8: LEFT-TURN MODE

Location: 4-leg signalized intersection

INPUT DATA

General Information

Cycle length: 100 s

Phase 2 direction: Eastbound

Volume and Lane Geometry Input Data

Approach	Eastbound		Westbound		Northbound		Southbound	
Movement	Left	Thru	Left	Thru	Left	Thru	Left	Thru
Volume, veh/h	39	451	62	673	48	189	50	306
Lanes	1	2	1	2	1	2	1	2

Crash History Data

Approach Eastbound		Westbound	Northbound	Southbound	
Left-turn crashes	4	5	4	2	

Time period for crashes: 2 years

Speed and Sight Distance Data

East/west approach speed: 45 mph North/south approach speed: 35 mph East/west sight distance: 335 ft North/south sight distance: 400 ft

OUTPUT SUMMARY

What is the suggested left-turn mode? (circle one)

Approach	Eastbound	Westbound	Northbound	Southbound
	Protected-only	Protected-only	Protected-only	Protected-only
Left-turn mode	Protected- permissive	Protected- permissive	Protected- permissive	Protected- permissive
	Permissive	Permissive	Permissive	Permissive

TRAFFIC SIGNAL OPERATIONS WORKSHOP

Dat Loc	e: ation:					
You	ar Agency:					
You	ar Position:					
Cot	arse Content (circle one)					
		Yes				No
1.	Did the course meet your expectations? Comments:	1	2	3	4	5
2.	Was the material presented at the correct level of difficulty?	1	2	3	4	5
	Comments:	-				
3.	Was the topic of the course covered adequately (nothing left out, no one topic overemphasized)?	1	2	3	4	5
	Comments:	-				
4.	Was the software easy to use? Comments:	1	2	3	4	5

General Observations

5.	What did you like most about the course?
6.	What did you like the least about the course?
7.	What can we do to improve this workshop?
8.	Other Comments:

Thank you for taking the time to complete this course evaluation form. Please make sure the course instructor receives it before you leave.
