ACKNOWLEDGMENTS

This project was conducted in cooperation with TxDOT and FHWA. The project team would like to thank Mr. Wade Odell, P.E., with the TxDOT Research and Technology Implementation Office, for his assistance as project manager. Additionally, the contributions and input of Mr. Ken Mora, P.E., with the TxDOT Design Division, were instrumental to the success of the project and are greatly appreciated.

Chapter 1. INTRODUCTION

1.1. BACKGROUND

An implementation agreement was adopted by the American Association of State Highway and Transportation Officials (AASHTO) and the Federal Highway Administration (FHWA) that coincided with the publication of the second edition of the AASHTO *Manual for Assessing Safety Hardware (MASH)* (1). Subsequently, numerous roadside safety devices have been crash tested to evaluate compliance with *MASH* impact performance criteria.

The Texas Department of Transportation (TxDOT) used this *MASH* testing need as an opportunity to improve the design of some devices in its roadside safety standards. One of the devices for which improvements were desired is a portable concrete barrier with X-bolt connection. Some of the details incorporated into this barrier system result in a relatively high fabrication cost that has limited its implementation to date.

In a previous research project, a 42-inch-tall single-slope precast barrier system with X-bolt connection was developed (2, 3). Changes were made to the X-bolt connection design to help optimize its fabrication. Specifically, the welded X-bolt connection assemblies, which consisted of an embedded steel connection plate, a welded steel connection pipe through which the threaded rod was inserted, and two welded deformed bar anchors, were eliminated. The embedded steel connection plate was replaced with a plate washer, and the steel connection pipe was replaced with a PVC pipe. Some additional U-bars were placed longitudinally at the ends of the segment for additional structural capacity. The single-slope precast concrete barrier with modified X-bolt connection was successfully tested to *MASH* Test Level 4 (TL-4) impact conditions in both restrained and freestanding configurations (2, 3).

TxDOT wished to incorporate similar connection details into the F-shape precast concrete barrier system. The reduced fabrication cost of the modified design may lead to more widespread implementation of this low-deflection portable concrete barrier system. The low deflection provides advantages in some work zones by reducing the buffer or offset distance required between the barrier and work zone personnel and equipment.

1.2. OBJECTIVE

The objective of the testing reported herein was to assess the performance of a freestanding, precast F-shape barrier with modified X-bolt connection according to the safety-performance evaluation guidelines included in AASHTO *MASH* for TL-3 longitudinal barriers. This report presents details of the crash test performed, an assessment of the results, and implementation recommendations for the precast F-shape barrier with modified X-bolt connection.

Chapter 2. SYSTEM DETAILS

2.1. TEST ARTICLE AND INSTALLATION DETAILS

The test installation consisted of seven 30-ft-long precast steel reinforced portable concrete barrier (PCB) segments placed end to end, for a total length of 210 ft. The barriers were connected to each other using two 29-inch-long sections of a 7/8-inch-diameter B7 threaded rod and associated hardware at each joint. The threaded rod passes through PVC pipe cast into the ends of the barrier segments at two different elevations that form an “X” in plan view. Recesses were cast in the exterior faces of the barriers so that the ends of the threaded rod and associated hardware did not protrude past the exterior faces. All barriers were freestanding (not secured to the concrete apron).

The barrier segments measured 24 inches wide at bottom, 9½ inches wide at top, and 32 inches tall. The traffic and field side faces were symmetric, with an F-shape profile.

Figure 2.1 presents the overall information on the F-shape PCB with X-bolt connection, and Figure 2.2 provides photographs of the test installation. Appendix A provides further details on the F-shape PCB with X-bolt connection. The barrier segments were fabricated by Summit Precast Concrete based on drawings provided by the Texas A&M Transportation Institute (TTI) Proving Ground. The barriers were installed by TTI Proving Ground personnel.

2.2. DESIGN MODIFICATIONS DURING TESTS

No modifications were made to the installation during the testing phase.

2.3. MATERIAL SPECIFICATIONS

The specified compressive strength of the TxDOT Class H concrete used in the F-shape PCB with X-bolt connection was 3600 psi. On April 16, 2021, the day after the test, the average compressive strength of the concrete for barrier segment 3 was 5750 psi and for barrier segment 4 was 6410 psi.

Appendix B provides material certification documents for the materials used to construct the F-shape PCB with X-bolt connection.

Q:\Accreditation-17025-2017\EIR-000 Project Files\440861 - TxDOT FY2021\440861-01 PCB with X-bolt\Drafting, 440861-1\440861-1 Drawing

Figure 2.1. Details of F-Shape PCB with X-Bolt Connection.

Figure 2.2. F-Shape PCB with X-Bolt Connection prior to Testing.

Chapter 3. TEST REQUIREMENTS AND EVALUATION CRITERIA

3.1. CRASH TEST PERFORMED/MATRIX

Table 3.1 shows the test conditions and evaluation criteria for *MASH* TL-3 for longitudinal barriers. This report presents testing of the F-shape PCB with X-bolt connection in accordance with *MASH* Test 3-11 evaluation criteria. The target critical impact point (CIP) for *MASH* Test 3-11 was determined using the information provided in *MASH* Section 2.3.2.1 and *MASH* Table 2-7, which is depicted in Figure 3.1.

Table 3.1. Test Conditions and Evaluation Criteria Specified for *MASH* TL-3 Longitudinal Barriers.

Test Article	Test Designation	Test Vehicle	Impact Conditions		Evaluation Criteria
			Speed	Angle	
Longitudinal Barrier	3-10	1100C	62 mi/h	25°	A, D, F, H, I
	3-11	2270P	62 mi/h	25°	A, D, F, H, I

Figure 3.1. Target CIP for *MASH* Test 3-11 on F-Shape PCB with X-Bolt Connection.

MASH also recommends performing Test 3-10 with the small passenger car. However, based on the performance of the F-shape barrier in previous testing, Test 3-10 was not considered necessary. Further discussion of the rationale for this conclusion is provided in Chapter 7.

The crash tests and data analysis procedures were in accordance with guidelines presented in *MASH*. Chapter 4 presents brief descriptions of these procedures.

3.2. EVALUATION CRITERIA

The appropriate safety evaluation criteria from Tables 2-2 and 5-1 of *MASH* were used to evaluate the crash test reported herein. Table 3.1 lists the test conditions and evaluation criteria required for *MASH* TL-3, and Table 3.2 provides detailed information on the evaluation criteria. An evaluation of the crash test results is presented in Chapter 6.

Table 3.2. Evaluation Criteria Required for MASH TL-3 Longitudinal Barriers.

Evaluation Factors	Evaluation Criteria
Structural Adequacy	<p>A. <i>Test article should contain and redirect the vehicle or bring the vehicle to a controlled stop; the vehicle should not penetrate, underride, or override the installation although controlled lateral deflection of the test article is acceptable.</i></p>
Occupant Risk	<p>D. <i>Detached elements, fragments, or other debris from the test article should not penetrate or show potential for penetrating the occupant compartment, or present undue hazard to other traffic, pedestrians, or personnel in a work zone.</i></p> <p><i>Deformations of, or intrusions into, the occupant compartment should not exceed limits set forth in Section 5.2.2 and Appendix E of MASH.</i></p>
	<p>F. <i>The vehicle should remain upright during and after collision. The maximum roll and pitch angles are not to exceed 75 degrees.</i></p>
	<p>H. <i>Occupant impact velocities (OIV) should satisfy the following limits: Preferred value of 30 ft/s, or maximum allowable value of 40 ft/s.</i></p>
	<p>I. <i>The occupant ridedown accelerations should satisfy the following: Preferred value of 15.0 g, or maximum allowable value of 20.49 g.</i></p>

Chapter 4. TEST CONDITIONS

4.1. TEST FACILITY

The full-scale crash test reported herein was performed at the TTI Proving Ground, an International Standards Organization (ISO)/International Electrotechnical Commission (IEC) 17025-accredited laboratory with American Association for Laboratory Accreditation (A2LA) Mechanical Testing Certificate 2821.01. The full-scale crash test was performed according to TTI Proving Ground quality procedures, as well as *MASH* guidelines and standards.

The test facilities of the TTI Proving Ground are located on The Texas A&M University System RELIS Campus, which consists of a 2000-acre complex of research and training facilities situated 10 mi northwest of the flagship campus of Texas A&M University. The site, formerly a United States Army Air Corps base, has large expanses of concrete runways and parking aprons well suited for experimental research and testing in the areas of vehicle performance and handling, vehicle-roadway interaction, highway pavement durability and efficacy, and roadside safety hardware and perimeter protective device evaluation. The site selected for construction and testing of the F-shape PCB with X-bolt connection was along the surface of an out-of-service apron. The apron consists of an unreinforced jointed-concrete pavement in 12.5-ft × 15-ft blocks nominally 6 inches deep. The aprons were built in 1942, and the joints have some displacement but are otherwise flat and level.

4.2. VEHICLE TOW AND GUIDANCE SYSTEM

The vehicle was towed into the test installation using a steel cable guidance and reverse tow system. A steel cable for guiding the test vehicle was tensioned along the path, anchored at each end, and threaded through an attachment to the front wheel of the test vehicle. An additional steel cable was connected to the test vehicle, passed around a pulley near the impact point and through a pulley on the tow vehicle, and then anchored to the ground such that the tow vehicle moved away from the test site. A 2:1 speed ratio between the test and tow vehicle existed with this system. Just prior to impact with the installation, the test vehicle was released and ran unrestrained. The vehicle remained freewheeling (i.e., no steering or braking inputs) until it cleared the immediate area of the test site.

4.3. DATA ACQUISITION SYSTEM

4.3.1. Vehicle Instrumentation and Data Processing

The test vehicle was instrumented with a self-contained onboard data acquisition system. The signal conditioning and acquisition system is a 16-channel Tiny Data Acquisition System (TDAS) Pro produced by Diversified Technical Systems Inc. The accelerometers, which measure the x, y, and z axis of vehicle acceleration, are strain gauge type with linear millivolt output proportional to acceleration. Angular rate sensors, measuring vehicle roll, pitch, and yaw rates, are ultra-small, solid-state units designed for crash test service. The TDAS Pro hardware and software conform to the latest SAE J211, Instrumentation for Impact Test. Each of the 16 channels is capable of providing precision amplification, scaling, and filtering based on transducer specifications and calibrations. During the test, data are recorded from each channel at

a rate of 10,000 samples per second with a resolution of one part in 65,536. Once data are recorded, internal batteries back up the data inside the unit in case the primary battery cable is severed. Initial contact of the pressure switch on the vehicle bumper provides a time zero mark and initiates the recording process. After each test, the data are downloaded from the TDAS Pro unit into a laptop computer at the test site. The Test Risk Assessment Program (TRAP) software then processes the raw data to produce detailed reports of the test results.

Each of the TDAS Pro units is returned to the factory annually for complete recalibration and to ensure that all instrumentation used in the vehicle conforms to the specifications outlined by SAE J211. All accelerometers are calibrated annually by means of an ENDEVCO® 2901 precision primary vibration standard. This standard and its support instruments are checked annually and receive a National Institute of Standards Technology (NIST) traceable calibration. The rate transducers used in the data acquisition system receive calibration via a Genisco Rate-of-Turn table. The subsystems of each data channel are also evaluated annually, using instruments with current NIST traceability, and the results are factored into the accuracy of the total data channel per SAE J211. Calibrations and evaluations are also made anytime data are suspect. Acceleration data are measured with an expanded uncertainty of ± 1.7 percent at a confidence factor of 95 percent ($k = 2$).

TRAP uses the data from the TDAS Pro to compute the occupant/compartment impact velocities, time of occupant/compartment impact after vehicle impact, and highest 10-millisecond (ms) average ridedown acceleration. TRAP calculates change in vehicle velocity at the end of a given impulse period. In addition, maximum average accelerations over 50-ms intervals in each of the three directions are computed. For reporting purposes, the data from the vehicle-mounted accelerometers are filtered with an SAE Class 180-Hz low-pass digital filter, and acceleration versus time curves for the longitudinal, lateral, and vertical directions are plotted using TRAP.

TRAP uses the data from the yaw, pitch, and roll rate transducers to compute angular displacement in degrees at 0.0001-s intervals, and then plots yaw, pitch, and roll versus time. These displacements are in reference to the vehicle-fixed coordinate system with the initial position and orientation being initial impact. Rate-of-rotation data are measured with an expanded uncertainty of ± 0.7 percent at a confidence factor of 95 percent ($k = 2$).

4.3.2. Anthropomorphic Dummy Instrumentation

According to *MASH*, use of a dummy in the 2270P vehicle is optional, and no dummy was used in the test.

4.3.3. Photographic Instrumentation Data Processing

Photographic coverage of the test included three digital high-speed cameras:

- One placed overhead with a field of view perpendicular to the ground and directly over the impact point.
- One placed upstream from the installation at an angle to have a field of view of the interaction of the rear of the vehicle with the installation.
- A third placed with a field of view parallel to and aligned with the installation at the downstream end.

A flashbulb on the impacting vehicle was activated by a pressure-sensitive tape switch to indicate the instant of contact with the F-shape PCB with X-bolt connection. The flashbulb was visible from each camera. The video files from these digital high-speed cameras were analyzed to observe phenomena occurring during the collision and to obtain time-event, displacement, and angular data. A digital camera recorded and documented conditions of each test vehicle and the installation before and after the test.

Chapter 5. MASH TEST 3-11 (CRASH TEST NO. 440861-01-1)

5.1. TEST DESIGNATION AND ACTUAL IMPACT CONDITIONS

MASH Test 3-11 involves a 2270P vehicle weighing 5000 lb \pm 110 lb impacting the CIP of the longitudinal barrier at an impact speed of 62 mi/h \pm 2.5 mi/h and an angle of 25 degrees \pm 1.5 degrees. The CIP for MASH Test 3-11 on the F-shape PCB with X-bolt connection was 4.3 ft \pm 1 ft upstream of the centerline of the joint between barrier segments 3 and 4. Figure 3.1 and Figure 5.1 depict the target impact setup.

Figure 5.1. F-Shape PCB with X-Bolt Connection/Test Vehicle Geometrics for Test No. 440861-01-1.

The 2270P vehicle weighed 5031 lb, and the actual impact speed and angle were 62.4 mi/h and 24.8 degrees. The actual impact point was 4.0 ft upstream of the centerline of the joint between barrier segments 3 and 4. Minimum target impact severity (IS) was 106 kip-ft, and actual IS was 115 kip-ft.

5.2. WEATHER CONDITIONS

The test was performed on the morning of April 15, 2021. Weather conditions at the time of testing were as follows: wind speed: 9 mi/h; wind direction: 65 degrees (vehicle was traveling at a heading of 350 degrees); temperature: 65°F; relative humidity: 86 percent.

5.3. TEST VEHICLE

Figure 5.2 shows the 2016 RAM 1500 pickup truck used for the crash test. The vehicle's test inertia weight was 5031 lb, and its gross static weight was 5031 lb. The height to the lower edge of the vehicle bumper was 11.75 inches, and the height to the upper edge of the bumper was 27.0 inches. The height to the vehicle's center of gravity was 28.25 inches. Tables C.1 and C.2 in Appendix C.1 give additional dimensions and information on the vehicle. The vehicle was directed into the installation using a cable reverse tow and guidance system and was released to be freewheeling and unrestrained just prior to impact.

Figure 5.2. Test Vehicle before Test No. 440861-01-1.

5.4. TEST DESCRIPTION

Table 5.1 lists events that occurred during Test No. 440861-01-1. Figures C.1 and C.2 in Appendix C.2 present sequential photographs during the test.

Table 5.1. Events during Test No. 440861-01-1.

Time (s)	Events
0.0000	Vehicle impacts the barrier
0.0130	Left front tire lifts off the pavement
0.0380	Vehicle begins to redirect
0.0910	Right front tire lifts off the pavement
0.1230	Right rear tire lifts off the pavement
0.2220	Vehicle travels parallel with the barrier
0.2340	Left rear bumper impacts the barrier
0.4370	Left front tire makes contact with the pavement
0.5580	Right front tire makes contact with the pavement
1.0220	Left front tire makes secondary contact with the barrier

For longitudinal barriers, it is desirable for the vehicle to redirect and exit the barrier within the exit box criteria (not less than 32.8 ft downstream from loss of contact for cars and pickups). The test vehicle exited within the exit box criteria defined in *MASH*. Brakes on the vehicle were applied at 3.0 s after impact, and the vehicle came to rest 239 ft downstream of the point of impact and 23 ft toward the field side.

5.5. DAMAGE TO TEST INSTALLATION

Figure 5.3 and Figure 5.4 show the damage to the F-shape PCB with X-bolt connection. There was scuffing from multiple impacts downstream from the initial loss of contact. One of the bolts connecting barrier 3 to barrier 2 was deformed, and both bolts at the joint of barriers 3 and 4 were deformed. The red lines shown in the photos indicate cracks observed post-impact.

Table 5.2 and Table 5.3 provide barrier movement and barrier damage, respectively. Working width* was 48.3 inches, and height of working width was 3.0 inches. Maximum dynamic deflection during the test was 26.6 inches, and maximum permanent deformation was 25.5 inches.

Figure 5.3. F-Shape PCB with X-Bolt Connection after Test No. 440861-01-1.

* Per *MASH*, “The working width is the maximum dynamic lateral position of any major part of the system or vehicle. These measurements are all relative to the pre-impact traffic face of the test article.” In other words, working width is the total barrier width plus the maximum dynamic intrusion of any portion of the barrier or test vehicle past the field side edge of the barrier.

Figure 5.4. Field Side of F-Shape PCB with X-Bolt Connection after Test No. 440861-01-1.

Table 5.2. Barrier Movement and Damage after Test No. 440861-01-1.

Joint	Movement			Notes
	T/S	F/S	D/S	
1	—	—	—	—
1-2	—	—	—	—
2-3	—	¾ inch	2 inches	Cracks at the T/S & F/S X-bolt locations
3-4	—	25½ inches	—	Cracks at F/S X-bolt locations
4-5	—	3 inches	—	Cracks at the T/S & F/S X-bolt locations
5-6	¾ inch	—	—	—

7	—	—	—	—

Note: T/S = toward traffic side; F/S = toward field side; D/S = downstream movement; — = no data to report.

Table 5.3. Barrier Damage after Test No. 440861-01-1.

Barrier	Spalling Location	Cracking Location	Notes
1	—	—	—
2	Downstream Field Side	—	—
3	Downstream Traffic Side	Upstream Field Side	Exposed rebar; 30-inch piece of concrete broken off from traffic side toe
4	Downstream Field Side	—	Scuffing and gouging on traffic side
5	Upstream Field Side	—	—
6	—	Upstream Field Side	Gouging at downstream scupper on traffic side
7	—	—	—

Note: — = no data to report.

5.6. DAMAGE TO TEST VEHICLE

Figure 5.5 shows the damage sustained by the vehicle. The front bumper, hood, grill, left front fender, left front tire and rim, left front and rear doors, left front corner of the floor pan, left rear cab corner, left rear exterior bed, left rear tire and rim, and rear bumper were damaged. No fuel tank damage was observed. No windshield damage was observed. Maximum exterior crush to the vehicle was 11.0 inches in the side plane at the left front corner at bumper height. Maximum occupant compartment deformation was 1.0 inch in the left front firewall/toe pan area. Figure 5.6 shows the interior of the vehicle. Tables C.3 and C.4 in Appendix C.1 provide exterior crush and occupant compartment measurements.

Figure 5.5. Test Vehicle after Test No. 440861-01-1.

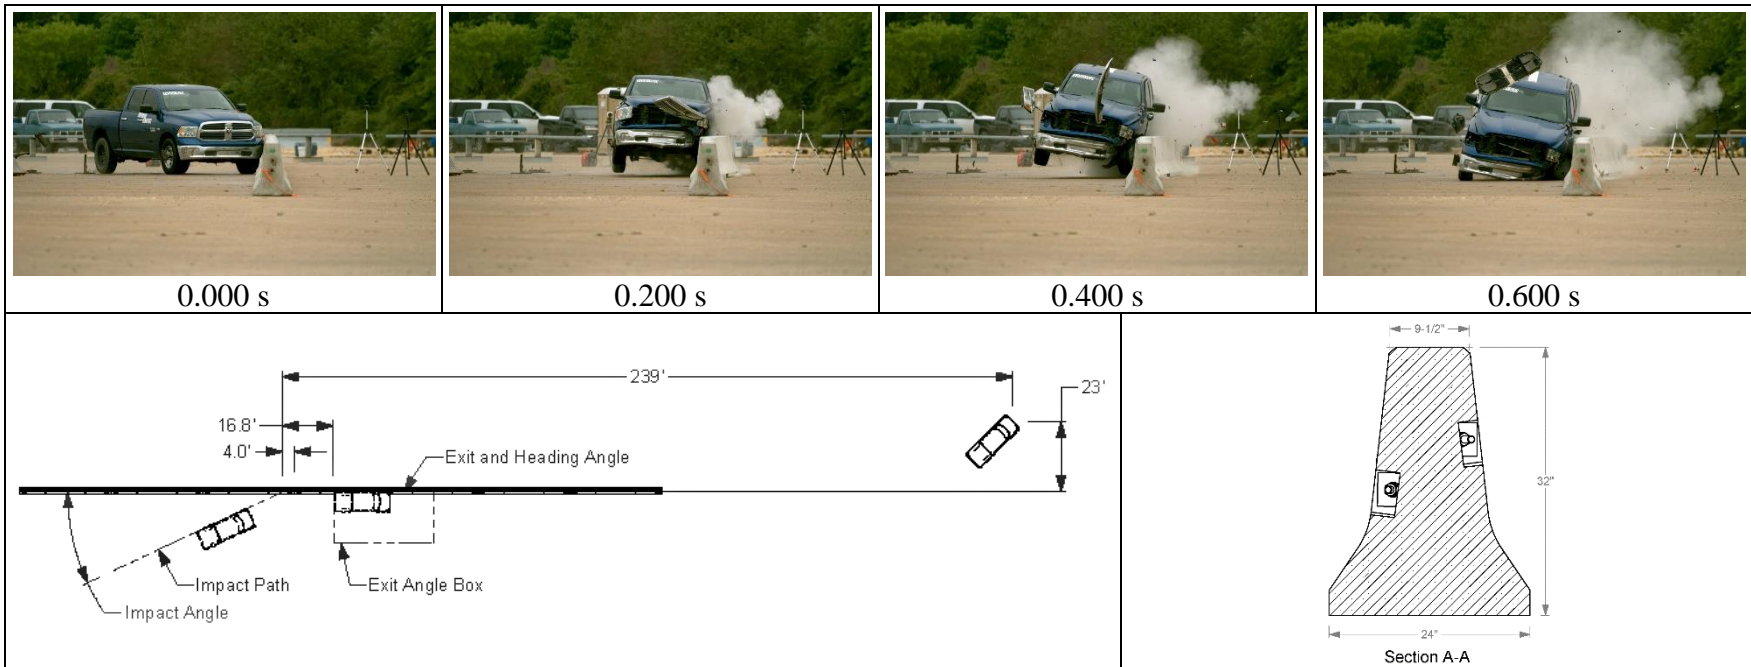

Figure 5.6. Interior of Test Vehicle after Test No. 440861-01-1.

5.7. OCCUPANT RISK FACTORS

Data from the accelerometers were digitized for evaluation of occupant risk, and the results are shown in Table 5.4. Figure C.3 in Appendix C.3 shows the vehicle angular displacements, and Figures C.4 through C.6 in Appendix C.4 show acceleration versus time traces. Figure 5.7 summarizes pertinent information from the test.

Table 5.4. Occupant Risk Factors for Test No. 440861-01-1.

Occupant Risk Factor	Value	Time
Occupant Impact Velocity (OIV)		
Longitudinal	17.6 ft/s	at 0.0971 s on left side of interior
Lateral	22.7 ft/s	
Occupant Ridedown Accelerations		
Longitudinal	4.2 g	0.2527–0.2627 s
Lateral	11.0 g	0.2565–0.2665 s
Theoretical Head Impact Velocity (THIV)	8.8 m/s	at 0.0940 s on left side of interior
Acceleration Severity Index (ASI)	1.7	0.0529–0.1029 s
Maximum 50-ms Moving Average		
Longitudinal	–8.8 g	0.0228–0.0728 s
Lateral	12.3 g	0.0320–0.0820 s
Vertical	–3.6 g	0.0233–0.0733 s
Maximum Roll, Pitch, and Yaw Angles		
Roll	11°	0.4922 s
Pitch	8°	0.6045 s
Yaw	31°	0.2763 s

General Information

Test Agency..... Texas A&M Transportation Institute (TTI)
 Test Standard Test No. MASH Test 3-11
 TTI Test No. 440861-01-1
 Test Date 2021-04-15

Test Article

Type Longitudinal Barrier—PCB
 Name F-shape PCB with X-bolt connection
 Installation Length 210 ft—seven 30-ft segments
 Material or Key Elements ... 32-inch-tall F-shape portable concrete barrier; 7/8-inch diameter threaded rod forms X-bolt connection

Soil Type and Condition

Concrete pavement, damp

Test Vehicle

Type/Designation 2270P
 Make and Model 2016 RAM 1500 Pickup
 Curb 5137 lb
 Test Inertial 5031 lb
 Dummy No dummy
 Gross Static 5031 lb

Impact Conditions

Speed 62.4 mi/h
 Angle 24.8°
 Location/Orientation 4.0 ft upstream of joint 3/4

Impact Severity

115 kip-ft

Exit Conditions

Speed Out of view
 Trajectory/Heading Angle... Along barrier

Occupant Risk Values

Longitudinal OIV 17.6 ft/s
 Lateral OIV 22.7 ft/s
 Longitudinal Ridedown 4.2 g
 Lateral Ridedown 11.0 g
 THIV 8.8 m/s
 ASI 1.7

Max. 0.050-s Average

Longitudinal -8.8 g
 Lateral 12.3 g
 Vertical -3.6 g

Post-Impact Trajectory

Stopping Distance 239 ft downstream
 23 ft twd field side

Vehicle Stability

Maximum Roll Angle 11°
 Maximum Pitch Angle 8°
 Maximum Yaw Angle 31°
 Vehicle Snagging No
 Vehicle Pocketing No

Test Article Deflections

Dynamic 26.6 inches
 Permanent 25.5 inches
 Working Width 48.3 inches
 Height of Working Width 3.0 inches

Vehicle Damage

VDS 11LFQ4
 CDC 11FLEW3
 Max. Exterior Deformation 11.0 inches
 OCDI LF0010000
 Max. Occupant Compartment Deformation 1.0 inch

Figure 5.7. Summary of Results for MASH Test 3-11 on F-Shape PCB with X-Bolt Connection.

Chapter 6. SUMMARY AND CONCLUSIONS

6.1. ASSESSMENT OF TEST RESULTS

The crash test reported herein was performed in accordance with *MASH* Test 3-11. Table 6.1 provides an assessment of the test based on the applicable safety evaluation criteria for *MASH* Test 3-11 for longitudinal barriers.

6.2. CONCLUSIONS

The F-shape PCB with X-bolt connection met the performance criteria for *MASH* Test 3-11 for longitudinal barriers.

Table 6.1. Performance Evaluation Summary for MASH Test 3-11 on F-Shape PCB with X-Bolt Connection.

Test Agency: Texas A&M Transportation Institute

Test No.: 440861-01-1

Test Date: 2021-04-15

MASH Test 3-11 Evaluation Criteria	Test Results	Assessment
<u>Structural Adequacy</u>		
A. <i>Test article should contain and redirect the vehicle or bring the vehicle to a controlled stop; the vehicle should not penetrate, underride, or override the installation although controlled lateral deflection of the test article is acceptable.</i>	The F-shape PCB with X-bolt connection contained and redirected the 2270P vehicle. The vehicle did not penetrate, underride, or override the installation. Maximum dynamic deflection during the test was 26.6 inches.	Pass
<u>Occupant Risk</u>		
D. <i>Detached elements, fragments, or other debris from the test article should not penetrate or show potential for penetrating the occupant compartment, or present an undue hazard to other traffic, pedestrians, or personnel in a work zone.</i>	Some concrete spalling occurred at several joints; however, this debris did not penetrate or show potential for penetrating the occupant compartment or present an undue hazard to others in the area.	Pass
<i>Deformations of, or intrusions into, the occupant compartment should not exceed limits set forth in Section 5.2.2 and Appendix E of MASH.</i>	Maximum occupant compartment deformation was 1.0 inch in the left front firewall/toe pan area.	
F. <i>The vehicle should remain upright during and after collision. The maximum roll and pitch angles are not to exceed 75 degrees.</i>	The 2270P vehicle remained upright during and after the collision event. Maximum roll and pitch angles were 11 degrees and 8 degrees.	Pass
H. <i>Occupant impact velocities (OIV) should satisfy the following limits: Preferred value of 30 ft/s, or maximum allowable value of 40 ft/s.</i>	Longitudinal OIV was 17.6 ft/s, and lateral OIV was 22.7 ft/s.	Pass
I. <i>The occupant ridedown accelerations should satisfy the following limits: Preferred value of 15.0 g, or maximum allowable value of 20.49 g.</i>	Longitudinal occupant ridedown acceleration was 4.2 g, and lateral occupant ridedown acceleration was 11.0 g.	Pass

Chapter 7. IMPLEMENTATION*

Based on the results of the testing and evaluation reported herein, the F-shape PCB with X-bolt connection is considered suitable for implementation as a *MASH* TL-3 barrier system. The *MASH* matrix for TL-3 longitudinal barriers consists of two tests: Test 3-11 and Test 3-10. *MASH* Test 3-11 was performed under this project and successfully met all *MASH* evaluation criteria.

MASH also recommends performing Test 3-10 with the small passenger car. However, based on the performance of the F-shape barrier in previous testing, Test 3-10 was not considered necessary. The impact severity for *MASH* Test 3-10 is approximately half that of Test 3-11. Therefore, structural adequacy of the barrier is not an issue, and the barrier will deflect substantially less than in Test 3-11. When *MASH* Test 5-10 (similar impact conditions to *MASH* Test 3-10) was performed on a cast-in-place F-shape barrier with soundwall, all *MASH* criteria were satisfied (4). The passenger car was contained and redirected in a stable manner, and occupant risk criteria were below the preferred thresholds in *MASH*. Therefore, *MASH* occupant risk criteria associated with impacting the F-shape PCB with X-bolt connection should be satisfactory. F-shape PCBs have also been successfully tested with the 1100C passenger car in both freestanding and restrained conditions that resulted in dynamic deflections ranging from 3 to 56 inches (5, 6, 7). The occupant risk indices for these tests were acceptable, and the maximum roll angle of the vehicle ranged from 9.2 degrees to 25 degrees. Therefore, stability of the 1100C passenger vehicle impacting the F-shape PCB with X-bolt connection under *MASH* Test 3-10 conditions should be satisfactory.

The dynamic deflection for the F-shape PCB with X-bolt connection during *MASH* Test 3-11 was only 26.6 inches. This is significantly lower than the deflection of other connection types included in TxDOT standards. The low deflection makes the F-shape PCB with X-bolt connection suitable for many applications, including as a median barrier or a work zone barrier when such deflections can be accommodated.

Statewide implementation of this barrier can be achieved by TxDOT's Design Division through revision of standard detail sheet CSB(1)-10. The barrier details provided in Appendix A can be used for this purpose.

* The opinions/interpretations identified/expressed in this section of the report are outside the scope of TTI Proving Ground's A2LA Accreditation.

Test Methods:

The tests were performed in general accordance with applicable ASTM, AASHTO, or DOT test methods. This report is exclusively for the use of the client indicated above and shall not be reproduced except in full without the written consent of our company. Test results transmitted herein are only applicable to the actual samples tested at the location(s) referenced and are not necessarily indicative of the properties of other apparently similar or identical materials.

APPENDIX C. MASH TEST 3-11 (CRASH TEST NO. 440861-01-1)

C.1. VEHICLE PROPERTIES AND INFORMATION

Table C.1. Vehicle Properties for Test No. 440861-01-1.

Date: 2021-4-15 Test No.: 440861-01-1 VIN No.: 1C6RR6GT5GS269374
 Year: 2016 Make: RAM Model: 1500
 Tire Size: 265/70 R 17 Tire Inflation Pressure: 35 psi
 Tread Type: Highway Odometer: 128672
 Note any damage to the vehicle prior to test: None

• Denotes accelerometer location.

NOTES: None

Engine Type: V-8
 Engine CID: 5.7 L

Transmission Type:
 Auto or Manual
 FWD RWD 4WD

Optional Equipment:
