## IMPLEMENTATION STATEMENT

This report documents results of a special grant program, "Traffic Light Synchronization Grant Program II" rather than the results of a research study. Thus, there are no findings, recommended procedures for implementation, or additional work needed to achieve implementation.

## DISCLAIMER

The contents of this report reflect the views of the authors who are responsible for the opinions, findings, and conclusions presented herein. The contents do not necessarily reflect the official views or policies of the Texas Department of Transportation, Governor's Energy Office, or U.S. Department of Energy. This report does not constitute a standard, specification, or regulation and is NOT INTENDED FOR CONSTRUCTION, BIDDING, OR PERMIT PURPOSES. The engineer in charge of preparing this report was Daniel B. Fambro, P.E. No. 47535 (Texas).

## ACKNOWLEDGEMENTS

The results reported herein were accomplished as a result of a program entitled "Traffic Light Synchronization II (TLS II) Grant Program." The program was administered by the Texas Department of Transportation and sponsored by the Governor's Energy Office in cooperation with the U.S. Department of Energy. Training and technical assistance for the program were provided by the Texas Transportation Institute and Texas Engineering Extension Service at Texas A\&M University and the McTrans Center at the University of Florida. Program managers/supervisors were Robert L. Otto, P.E., with the Governor's Energy Office, Carlos A. Lopez, P.E., and Ronald T. Barnes with the Texas Department of Transportation, and Daniel B. Fambro, P.E., with the Texas Transportation Institute. The authors wish to acknowledge the contributions of the many people who helped make this program a success.

The Texas Department of Transportation secured the funding, prepared the grant manual, and was responsible for all contractual and administrative matters. TxDOT staff members making significant contributions to the TLS II Program include:

| Byron C. Blaschke | Anna M. Isbell | Henry A. Thomason |
| :--- | :--- | :--- |
| Connie Bohuslav | Ernest W. Kanak | Gary K. Trietsch |
| Phil Fredricks | Michael J. McAndrew | Roger G. Welsch |
| Bob G. Hodge | Wilbur Mehaffey | Brenda Nilsson |
| Victor J. Holubec | Cindy Nelson |  |

The training manuals, related materials, and documentation of benefits were prepared by the Texas Transportation Institute and Texas Engineering Extension Service at Texas A\&M University, and the McTrans Center at the University of Florida. Staff members from these organizations that made significant contributions to the TLS II Program include:

James A. Bonneson<br>Victor Bhagat<br>Edmond C.P. Chang<br>John F. Cordary<br>Kenneth G. Courage<br>A. Nelson Evans<br>Christopher M. Hoff<br>Sarah M. Hubbard<br>Manjunath Kalsanka<br>Carroll J. Messer<br>Dana S. Mixson<br>Sreelata Nanduri<br>Brian Schamburger<br>Steven P. Venglar<br>Charles E. Wallace

## SUMMARY

The Texas Department of Transportation (TxDOT) was the administering agency for the Traffic Light Synchronization II (TLS II) Program, which was funded with Oil Overcharge funds made available through the Governor's Energy Office. The TLS II Program was approved by the United States Department of Energy as part of a package of transportationrelated programs with the objective of reducing energy consumption. TLS II resulted in a total of $\$ 7.7$ million of program funds and local matches being spent for the optimization of traffic signal timing plans and the replacement of outdated signal controller equipment across the state. As stated previously, the program's objective was to reduce traffic congestion and facilitate the flow of traffic, with the goal of achieving more efficient use of energy resources.

With 73 completed projects, the TLS II Program has resulted in benefits that will pay for the cost of the program many times over. These benefits were estimated from the required before and after studies that were submitted by the cities. These studies document the major goals of the TLS II Program -- reductions in fuel consumption and unnecessary delay and stops. All projects were evaluated using the same unit costs. The TLS II Program resulted in 1,348 intersections in 43 cities being improved; the expenditure of $\$ 7.7$ million of program funds and local matches; and annual reductions in fuel consumption, delay, and stops of 13.5 percent ( 20.8 million gallons), 29.6 percent ( 22 million hours), and 11.5 percent ( 729 million stops), respectively. The total savings to the public in the form of reduced fuel, delay, and stops will be approximately $\$ 252$ million in the next year alone. In regard to fuel savings, Texas motorists are realizing $\$ 2.68$ in savings for every dollar spent, and if stops and delay are included, Texas motorists are realizing $\$ 32.30$ in savings for every dollar spent. These savings will continue for the next few years without additional expenditures; therefore, the benefits to the public will be even greater.

Besides the intuitive benefits of reducing unnecessary vehicle stops, delays, fuel consumption and emissions, the TLS II Program brought together the diverse transportation community of city staffs, consultants, TxDOT personnel and researchers to improve traffic operations at the state's signalized intersections. The program also has increased the expertise of transportation professionals in Texas and created a traffic data base that can be used for additional transportation projects. Most importantly, perhaps, the TLS II Program has enhanced the image of the transportation profession by improving the quality of traffic flow on arterial streets in Texas, and helping to change the driver's perspective of always stopping at a "red" light to not stopping at a "green" light.

## CHAPTER ONE

## INTRODUCTION

It has been estimated that motor vehicles use approximately one-fifth of the total daily U.S. oil consumption while traveling through signalized intersections in urban areas. A significant portion of this fuel consumption is wasted due to poor signal timing. In street networks with poorly timed traffic signals, the fuel consumed by vehicles stopping and idling at traffic signals accounts for approximately 40 percent of network-wide vehicular fuel consumption. Improving traffic signal timing improves the quality of traffic flow 24 hours per day, 7 days per week with no sacrifice required on the part of the individual driver. Driving is made faster and easier for all cars, trucks, and buses using the street system (1).

It also has been estimated that of the approximately 240,000 urban signalized intersections in the United States, 30,000 are in need of signal timing optimization, while another 148,000 need signal timing optimization and upgrading outdated equipment. These types of projects generally provide noticeable improvements in traffic flow on arterial streets for relatively small costs (2). For example, past retiming projects have generally reported benefit/cost ratios between 20 to 1 and 30 to 1 (1). More significantly, however, an average of 10 gallons of fuel was saved for each dollar that was spent on signal retiming projects, i.e., about 10 cents in project costs for each gallon saved (3). Signal timing optimization projects are extraordinarily cost effective - providing an estimated 20 to 30 dollars in benefits for each project dollar invested.

In recognition of these potential savings, and as a result of the Oil Overcharge Restitutionary Act, the Texas Department of Transportation (TxDOT) in conjunction with the Governor's Energy Office secured funding and developed the Texas Traffic Light Synchronization (TLS) Program for retiming traffic signals and replacing outdated equipment on city streets. The objective of this program was to reduce traffic congestion and facilitate the flow of traffic, with the goal of achieving more efficient use of energy resources. This objective was accomplished by:

1. Selecting projects and administering grants;
2. Training local staff/consultants in the use of computer technology for timing traffic signals;
3. Providing technical assistance in the use of computer models;
4. Providing technical assistance in collecting data and retiming signals; and
5. Providing for the replacement of outdated equipment.

This report documents the benefits resulting from the second phase of this program, TLS II. The following sections describe the Texas TLS Program in greater detail.

## Program Description

The Texas Department of Transportation (TxDOT) was the administering agency for the Traffic Light Synchronization (TLS) Program, which was funded with Oil Overcharge funds made available by the Governor's Energy Office. The United States Department of Energy (DOE) approved the TLS Program as part of a package of transportation-related programs with the objective of reducing energy consumption. TLS II resulted in a total of $\$ 7.7$ million of program funds and local matches being spent for the optimization of traffic signal timing plans and the replacement of outdated signal controller equipment across the state. As stated previously, the program's objective was to reduce traffic congestion and facilitate the flow of traffic, with the goal of achieving more efficient use of energy resources.

Besides the intuitive benefits of reducing unnecessary vehicle stops, delays, fuel consumption and emissions, the TLS program brought together the diverse transportation community of city staffs, consultants, TxDOT personnel and researchers to improve traffic operations at the state's signalized intersections. The program also has increased the signal timing expertise of transportation professionals in Texas and created a traffic data base that can be used for additional transportation projects. Most importantly, perhaps, the TLS Program has enhanced the image of the transportation profession by improving the quality of traffic flow, and helping to change the driver's perspective of always stopping at a "red" light to not stopping at a "green" light.

## Funding Distribution

TLS funds were expended through contracts administered by TxDOT on signal retiming projects proposed by local city governments. There were three major funding categories: large cities (cities with populations over 200,000), medium-sized cities (cities with populations ranging between 50,000 and 200,000 ), and small cities (cities with populations under 50,000 ). The approved program of work is shown in Table 1 , totaling 43 cities, 73 arterial and network signal system projects, and 1,348 of the state's approximately 13,000 traffic signals.

Fifty percent of available funds were expended in large cities, with each of the eight Texas cities presently over 200,000 population assigned an allotment proportional to its population; 16 medium and 19 small cities received 35 percent and 15 percent, respectively, of available funds. This distribution of funds helped to achieve one of the goals of the TLS program -- a widespread, geographic distribution of funds which allowed indirect restitution to a large segment of the population that was overcharged by the oil companies.

Table 1. Traffic Light Synchronization (TLS II) Program of Work

| Funding Category | Cities | Systems | Signals |
| :--- | :---: | :---: | :---: |
| Large Cities | 8 | 22 | 802 |
| Medium Cities | 16 | 23 | 339 |
| Small Cities | $\underline{19}$ | $\underline{28}$ | $\underline{207}$ |
| Totals | 43 | 73 | 1,348 |

## Selection Criteria

Projects were recommended for funding using the following criteria developed by an advisory panel composed of local government officials and TxDOT personnel:

1. Operational Characteristics of the Traffic Signal System - operational characteristics such as delay, average travel speed, average daily traffic, etc., were used to estimate the benefits improved signal timing could produce. This criteria was used to identify projects with the greatest needs and maximum potential benefits.
2. Availability of Local Staff to Implement Timing Plans - having local staff available allows the knowledge gained through the required technical training to be retained and facilitates future retiming efforts by local city governments.
3. Average Signal Spacing - the greater the concentration of signals, the more important synchronization and optimal signal timing become. A signal must have been no further than one mile from an adjacent signal for it to be considered part of a signal system.
4. Other Criteria such as Recent Growth in the Project Area, Date of Last Retiming Effort, Level of Expansion Over Current Effort, and Certification that TLS Funds will supplement and not Supplant Existing Funds - this criteria aided in determining where the need for TLS funds was greatest and where maximum benefit could be achieved.

## Reimbursement Guidelines and Eligibility

Up to 75 percent of project costs were eligible for reimbursement. If a project was funded, the local government or TxDOT paid a minimum of 25 percent of the total direct costs of the project in matching funds and/or in-kind services. TxDOT provided a local match when a project contained traffic signals that were maintained and operated by TxDOT, unless the local government and TxDOT agreed otherwise.

Costs eligible for reimbursement under the program included training local staff and/or consultants in the use of computer technology for retiming traffic signals; providing technical assistance in the use of the computer models; providing technical assistance in collecting data and retiming signals; and replacing outdated signal controller equipment. TLS Program funds could not be used to supplant or replace existing funds earmarked for specific signal retiming projects. That is, if existing funds were authorized for signal retiming expenditures, those funds could not be released and then replaced by TLS funds.

The TLS Program targeted traffic control systems (four signals minimum) currently coordinated and/or controlled in a manner that permitted implementation of multiple coordinated timing plans, i.e., timing plans that match traffic needs at different times of day. By focusing on traffic signal systems that currently have coordination capabilities, maximum energy savings could be realized with the available funds.

Signal systems included in the program ranged from those with sophisticated computercontrolled units to fixed-time electromechanical dial units. Many projects coordinated signals that were not presently a part of a coordinated system. Coordination is being supplied to previously isolated intersections by time-based (as opposed to hard-wire interconnect) methods. Signal controller equipment being purchased through a TLS project was, in general, either providing for coordination of a previously uncoordinated group of signals, adding signals to a currently coordinated system, or providing optimum signal timing capabilities.

## Training and Technical Assistance

One of the program's major objectives was to train local staff in the use of the PASSER II, PASSER III, and TRANSYT-7F signal timing models to facilitate ongoing maintenance of efficient timing plans. Local governments awarded a grant were required to have local project staff and/or their consultant attend specialized training workshops that were offered at the onset of the program. TxDOT secured the services of the Texas Transportation Institute (TTI) to provide signal timing training and technical assistance to the cities during project development. The McTrans Center at the University of Florida and the Texas Engineering Extension Service (TEEX) at Texas A\&M University assisted TTI in the training phase of the program. TTI also provided in-depth analysis of before and after studies submitted by cities and prepared the Final Report documenting reductions in fuel consumption, stops, and delay as a result of the TLS II Program for submission to the Governor's Energy Office.

Four training courses (2 PASSER, 2 TRANSYT) were offered through the TLS II Program. Through these courses, 60 transportation professionals were trained (listing shown in Appendix A). Also, each of the participating cities was furnished copies of the PASSER and TRANSYT computer software. This training of city, consultant, and TxDOT personnel helped achieve another TLS goal - providing statewide expertise in signal retiming techniques so that these efforts can continue long after the last TLS dollar is spent.

## TLS II General Facts

The following general facts relate to the TLS Program:

- Program Cost: $\$ 7,747,532$
- Date Started: April, 1991 - Request for Proposals (RFPs) issued.
- Number of Cities Participating:

43 (8 large, 16 medium, 19 small - listing and funding amounts shown in Appendix B)

- Number of Signal Systems:
- Number of Signals Retimed:
- Date Completed:

73
1,348; this total represents approximately $1 / 10$ of all the signals in the state.

February 1995 - Final Report submitted to TxDOT and the Governor's Office.

## CHAPTER TWO

## RESULTS

As mentioned in Chapter One, previous traffic signal retiming projects have reported benefit/cost ratios of 20 to 1 to 30 to 1 and an average fuel savings of approximately 10 gallons per dollar spent (1). It should be noted that ultraconservative values for time were used in computing these benefits, and if more realistic values had been used, the resultant benefit/cost ratios would have been much greater. The two signal retiming programs cited most often in the literature are the Federal Highway Administration's (FHWA's) National Signal Timing Optimization Project (1) and California's FETSIM (Fuel Efficient Traffic Signal Management) Program (3). In both programs, TRANSYT-7F was used to estimate motorist benefits as the hourly difference in fuel consumption and delay between the before and after retiming conditions. These differences were converted to annual differences and then multiplied by unit costs for fuel consumption and vehicular delay to obtain an estimate of annual benefits. The estimated improvements were validated with arterial travel time data from field studies during the before and after conditions. The TLS Program followed the same procedure for estimating benefits.

The benefits from the FETSIM Program (3) through 1988 were substantial - with an average first year reduction of 14 percent in stops and delay, 7.5 percent in travel time, and 8.1 percent in fuel use. Reductions in fuel usage in the first year were four times the program cost, and the first year benefit to cost ratio was 16 to 1 . The state cost per signal, including retiming, training, and technical assistance was approximately $\$ 1,500$ per intersection. Similar to the TLS Program, expenditures were allowed for all aspects of signal timing: data collection, data processing, timing plan development, implementation, and field evaluation. Unlike the TLS Program, however, expenditures were not allowed for replacing outdated equipment. Thus, the state cost per signal in the TLS Program will probably be slightly higher than in the FETSIM Program.

The preceding discussion demonstrates the range of benefits that have been obtained from other signal retiming projects, and can serve as a basis for comparison of the TLS Program. The following sections describe the results of the TLS Program in more detail and compare those results to other signal retiming programs.

## Program Results

With 73 projects completed, the TLS II Program has seen results that will pay for the cost of the program many times over. These results were estimated from the required before and after studies that were submitted by the cities. These studies document the major goal of the TLS program - reductions in fuel consumption and unnecessary delay and stops. All projects were evaluated using the same unit costs. The cost for fuel was based on current prices $\mathbf{( \$ 1 . 0 0}$
per gallon), and costs for delay and stops were based on values suggested by AASHTO (\$10 per vehicle-hour of delay and 1.4 cents per stop). A summary of the results follows:

- $\quad 73$ projects completed;
- 1,348 signals in 43 cities have been retimed;
- Approximately $\$ 7.7$ million of program funds and local matches have been expended (several cities expended more than the required local match);
- 20.8 million gallons of fuel will be saved within the next year alone;
- Texas motorists are realizing $\$ 2.68$ in fuel savings for every program dollar spent;
- Reductions in fuel consumption, delay, and stops were $13.5,29.6$, and 11.5 percent, respectively;
- The total savings to the public in the form of reduced fuel, delay, and stops will be approximately $\$ 252$ million within the next year alone; and
- The TLS II Program benefit to cost (b/c) ratio is 32 to 1 ; in other words, Texas motorists are realizing $\$ 32$ in savings for every program dollar spent.

The expected benefits during the first year after the signal timing improvements are implemented are summarized in Table 2. As expected, the majority of the benefits occurred in the large cities where population and traffic volumes are highest. Note, however, that substantial benefits also occurred in the medium and small cities, and that the average benefit to cost ratio for projects in small cities was 22 to 1 (47.5/2.1).

Table 2. Traffic Light Synchronization (TLS II) Program Annual Benefits

|  | Stops | Delay | Fuel | Savings | Cost |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Large Cities | $487,504,050$ | $13,125,028$ | $13,338,461$ | $151,413,795$ | $4,008,866$ |
| Medium Cities | $171,169,284$ | $4,664,466$ | $3,661,809$ | $52,702,835$ | $1,605,481$ |
| Small Cities | $70,628,388$ | $4,271,465$ | $3,797,688$ | $47,501,734$ | $2,133,185$ |
| Total | $729,301,722$ | $22,060,958$ | $20,797,958$ | $251,617,763$ | $7,747,532$ |

## Annual Benefits

The annual benefits estimated for each project were calculated on the basis of a 300-day year and a 10 to 15 -hour day, depending on local traffic conditions. These conservative hour per day values were used in order not to claim benefits when traffic volumes were low; i.e, retiming probably will not benefit weekend or late night traffic. In other words, an intentional effort was made to not overestimate benefits. Furthermore, field data from the required before and after arterial travel time runs were used to verify the benefits that were being estimated. These travel time improvements were comparable to the percentage reductions in fuel, delay, and stops.

Annual benefits and changes in measures of effectiveness for each of the 43 cities in the program are illustrated in Tables 3 and 4. Note that the majority of the benefits were in the large city category; however, significant benefits also occurred in the medium and small city categories. Given that higher traffic volumes are generally found in the larger cities, this result was expected. When interpreting this table, one should not try to compare between cities, as the number of retimed signals and the types of projects varied greatly between the cities. Generally, the more intersections that were retimed, the larger the improvements. For example, Austin retimed 240 intersections whereas Corpus Christi only retimed 9 intersections. As expected, the savings in Austin were greater than the savings in Corpus Christi; however, the percentage improvement in stops, delay, and fuel consumption was comparable.

Type of signal retiming project also had an impact on the estimated benefits. Generally, coordinating a previously uncoordinated system resulted in large improvements. Also, projects that involved the purchase of new hardware or arterial streets with relatively low traffic volumes resulted in low benefit to cost ratios. Finally, note that there were four cities with projects that resulted in increases in fuel consumption. These increases were a result of increases in side street delay in order to provide better flow along the arterial. The increase in fuel consumption was offset by decreases in stops and delay on the arterial streets, with the net effect being positive benefit to cost ratios.

The cost side of the benefit to cost (b/c) ratios reflect not only the time spent by local staff in developing and implementing timing plans but also the total equipment costs. Even though the equipment installed under a TLS project will likely last several years, the total equipment costs (not an amortized value) was used in the calculation of the $\mathrm{b} / \mathrm{c}$ ratios. Furthermore, the benefits were assumed to last only one year, when in reality some measure of the benefits will be realized over several years. Thus, the true benefits to Texas drivers are probably two to three times greater than the values reported in this report.

Table 3. Annual Benefits By City

| Cities | Number of Intersections | Stops | Percent | Delay (hrs) | Percent | $\begin{gathered} \text { Fuel } \\ \text { Cons. (gal) } \end{gathered}$ | Percent | Range of B/C Ratio(s) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Large Cities |  |  |  |  |  |  |  |  |

## Benefits Per Intersection

Annual benefits and changes in measures of effectiveness per intersection for each of the 43 cities in the program are illustrated in Tables 5 and 6. Note that on the average, more than 15,429 gallons of gasoline ( 13.5 percent), 16,366 hours of delay ( 29.6 percent), and 541,025 stops ( 11.5 percent) per intersection were saved as a result of this program. The values reported in these tables are somewhat easier to compare between cities and could be used to estimate a range of potential benefits from retiming a certain number of signalized intersections; however, the discrepancy between different traffic volumes and types of projects in each of the participating cities still exists.

Note that the average benefits per intersection are similar for the large, medium, and small city categories. The range of benefits per intersection within each city size category and, in some cases an overlap between categories is primarily the result of different types of projects. For example, coordinating a series of isolated intersections generally produced greater benefits than retiming an existing system. In other words, how bad or good the before condition was had a great deal to do with the benefits that could be obtained. Appendix $C$ presents benefits for nine different types of signal retiming projects.

## Comparison With Other Programs

The estimated benefits from the Texas TLS II Program are consistent with those reported by other statewide signal retiming programs. TLS II reduced fuel, delay, and stops by 13.5, 29.6, and 11.5 percent, respectively. California's FETSIM Program reduced fuel consumption by 8.1 percent and stops and delay by 14 percent. Texas motorists realized $\$ 2.68$ in fuel savings for every program dollar spent, whereas California motorists realized $\$ 4.00$ in fuel savings for every program dollar spent. It should be noted, however, that FETSIM used a slightly higher cost per gallon for fuel in their analysis. In terms of average annual fuel savings per intersection, TLS II and North Carolina's Traffic Signal Timing Optimization Program (4) estimated savings per intersection of 15,429 gallons and 13,900 gallons, respectively.

First year benefit to cost ratios were 32 to 1 for TLS $I$ and 16 to 1 for FETSIM; however, different delay costs were used by the two programs. Thus, the reported benefit to cost ratios are not easily comparable. Because the benefits of the two programs in terms of percent reductions in fuel, delay, and stops were essentially the same and the costs were higher for TLS because of equipment purchases (\$5,700 per intersection in TLS II and \$1,500 per intersection in FETSIM), the comparable benefit to cost ratios for TLS II were probably slightly lower than they were for FETSIM.

Table 5. Annual Benefits Per Intersection By City

## CHAPTER THREE

## CONCLUSIONS

The TxDOT experience in administering the TLS Program has been very positive. The working relationship between TxDOT and city transportation professionals has been enhanced, and Texas motorists have benefited from improved operation on many arterials. These benefits will extend well beyond the life of the TLS Program. Several cities have received positive press coverage as a result of improvements made through the TLS Program. Partial program results of the TLS I Program were presented at meetings of the Texas Section of the Institute of Transportation Engineers. Final program results are being shared with all 43 of the participating cities.

With 73 projects completed, the TLS II Program has seen results that will pay for the cost of the program many times over. These results were estimated from the required before and after studies that were submitted by the cities. These studies document the major goal of the TLS Program -- reductions in fuel consumption and unnecessary delay and stops. All projects were evaluated using the same unit costs. The TLS Program resulted in 1,348 signals in 43 cities ( 73 separate projects) being retimed; the expenditure of $\$ 7.7$ million of program funds and local matches; and annual reductions in fuel consumption, delay, and stops of 13.5 percent ( 20.8 million gallons), 29.6 percent ( 22 million hours), and 11.5 percent ( 729 million stops), respectively. Individual project summaries are presented in Appendices D, E, and F.

The total savings to the public in the form of reduced fuel, delay, and stops will be approximately $\$ 252$ million in the next year alone. In regard to fuel savings, Texas motorists are realizing $\$ 2.68$ in savings for every dollar spent, and if stops and delay are included, Texas motorists are realizing $\$ 32.30$ in savings for every dollar spent. These savings will continue for the next few years without additional expenditures; therefore, the benefits to the public will be even greater.

Benefits besides those that can be given a dollar value have been realized through the TLS Program. The bringing together of the entire transportation community (local, state, consultant, and academic) to try to reach a common goal has been rewarding. In the area of traffic signal retiming, the technical expertise of more than 60 transportation professionals has been enhanced. The driver perspective of the "stop" light or the "red" light is starting to change to that of the "green" light.

As a result of the success of the TLS I and TLS II programs, DOE and the Governor's Energy Office has provided additional resources in Oil Overcharge funds to TxDOT to undertake a third TLS Program. This third program, which will run from July 1994 until August 1995, should allow the benefits of improved signal timing to be realized in more areas of the state.

Overall, the TLS Program has been developed, funded, and implemented on a multijurisdictional basis (local city governments and state agencies). The program has had a significant visible and positive effect on actual operation on a large part of the transportation system, as well as on the citizens' perception of the system. The direct savings in fuel consumption and delay represents significant increased efficiency, resulting in a more economical transportation system.
