CONTROL SECTION

### Sandstone Sprinkle Treatment

U.S. Highway 181 is one of the two principal routes between San Antonio and Corpus Christi. In June, 1975, we let a contract on a section of U.S. 181 in Wilson County, generally within the city limits of Floresville, which is the county seat of Wilson County.

Work started July 23, 1975 and was completed November 1, 1977. The contractor was South Texas Construction Company. On this project, Special Specification 3030 (Sprinkle Treatment) was used in conjunction with Item 340, Hot Mix Asphaltic Concrete Pavement. This was used, of course, in order to increase the skid factor of the wearing surface.

The Asphaltic Concrete Pavement was batched using Type "D" Limestone Coarse Aggregate, and a local field sand. The design of the Asphaltic Concrete Pavement required 61.5% of the mineral aggregate retained on the No. 10 Screen, and a design asphalt content of 5.2%.

The Type "D" Asphaltic Concrete Pavement was placed at approximately 280° F., during the months of August and September, 1977. This pavement was placed both with and without traffic.

The Sprinkle Treatment Aggregate was a Grade 4 Sandstone precoated with 2% of AC-20 Asphalt. This material has a R.S.P.V. of 41, and an average L.A. Abrasion of 27. The material was dead hauled from the SanStone Pit at Pawlekville to the McDonough Plant at Beckman where it was precoated. It was then hauled from McDonough to Wilson County and stockpiled on the project.

The rate of Sprinkle Treatment varied from 1 C.Y. to 350 S.Y., to 1 C.Y. to 550 S.Y. We feel our best results were 1 C.Y. to approximately 450 S.Y.

Heavier applications seemed to create little nests of aggregate which would whip out under traffic, as this aggregate was loose, and could not be contained within the asphaltic concrete pavement.

The Sprinkle Treatment was applied dry, from the stockpile, and at ambient temperature.

An old Buck-Eye back-up type spreader was used. This spreader box was modified to span the pavement mat with its wheels, and was towed by the lay down machine using a yoke tongue with a standard ball trailer hitch.

The typical rolling pattern used with the Sprinkle Treatment was first, the three wheel break down roller; second, the tandem roller; and last, the pneumatic roller. The three wheel roller was following immediately behind the placing of the asphaltic concrete pavement. The tandem and the pneumatic had to be delayed in order to prevent the asphaltic concrete pavement from picking up and the sprinkle treatment from being whipped out.

The best results we found were obtained in the following steps:

1. Placing the ACP at approximately 280° F. The material would tend to pick up with the three wheel and the loose sprinkle treatment would also pick up at a higher temperature.
2. Placing the ACP without traffic (traffic being detoured) and restricting traffic from this lane for approximately 24 hours.
3. Delaying the tandem and the pneumatic rollers longer than usual and then keeping them rolling at a greater distance than normal behind the

operation. Using this procedure, a spin off result was that this aided in controlling traffic from using the new mat.

4. The Sprinkle Treatment was placed dry and at ambient temperature. The last day, however, the contractor ran short and the material used on that last day was delivered direct from the precoating operation, and was still hot and moist with asphalt. The Sprinkle Treatment in this condition did not flow evenly through the spreader box, and also had a tendency to be picked up by the three wheel roller.

We have placed Sprinkle Treatments on various projects throughout District 15. These Sprinkle Treatments have been placed both hot and cold. Except as noted above, we have found very little difference in the final results, whether the sprinkle material was hot or cold. However, when the sprinkle material is hot, it does have a tendency to congeal and consolidate as it goes through the spreader box, and we really don't get a good even flow.

Comparative costs for this project:

1. The Sprinkle Treatment Aggregate was bid at \$35.00 per cubic yard.
2. The Surface Course of the Asphaltic Concrete Pavement was placed at a rate of approximately 81 pounds per cubic yard.
3. With the established sprinkle rate of 1 C.Y. per 450 S.Y., the cost of the Sprinkle Treatment was then approximately \$.077 per S.Y., or approximately \$1.92 per ton of asphalt.

On Attachment "A" are skids taken on the Sprinkle Treatment on September 9, 1977, on the section that was not yet opened to traffic.

On Attachment "B", are skids taken October 14, 1977 after the sections were opened to traffic.

On Attachment "C", are the skids taken on November 16, 1977 of the control section which was not sprinkled.

On Attachment "D", are skids taken January 26, 1978.

On Attachment "E", are the skids taken March 1, 1978.

We will continue skidding this section at six month intervals, with the next skids being taken about September 1, 1978.
