## OBJECTIVES

A major problem encountered in overlaying a distressed pavement with asphalt concrete pavement concerns stabilizing the new pavement to prevent rutting and shoving at major high traffic volume intersections. The objective of an experimental project on U.S. Highways 60 and 66 in Potter County is to evaluate the performance of an asphalt concrete stabilizing additive to increase the resistance to shoving, rutting and movement under heavy traffic.

1

### PROJECT BACKGROUND

This project is located in Amarillo on Amarillo Boulevard. The roadway is at an elevation of 3650 ft. and is oriented from West to East. The soil is Pullman clay loam with a Plasticity Index (P. I.) between 21 and 27 and a Triaxial Class of 4.3 to 5.0.

The average annual rainfall is 20.28 in. with an average of 15 in. of snow. The mean annual temperature is 59 degrees Fahrenheit with a minimum of 21 degrees Fahrenheit in January. The lowest recorded temperature is -16 degrees Fahrenheit and daily variations of 30 degrees to 40 degrees are common.

The project was originally upgraded to multi-lanes in 1951. The roadway consisted of three 11 ft. lanes east and three 11 ft. lanes west with a 4 ft. concrete median strip. The structure of the pavement consisted of 14 in. of flexible base and 3 in. of asphalt concrete pavement (Ty C). The roadway had an 8 in. to 12 in. parabolic crown.

The project was overlaid in 1974 with 70 lbs/sq.yd. of asphalt concrete pavement (Ty F).

#### CONSTRUCTION PHASE

The asphalt concrete stabilizing additive and the locations where it was placed will be the only construction discussed here.

The asphalt stabilizing additive for this project was produced by the 3-M Company under the brand name of Asphadur.

The additive was introduced in the pug mill after the aggregate and asphalt had been mixed. The mixing was then continued an additional 60 seconds. The amount of additive used was 6 percent by weight of the asphalt content. The temperature selected for the stabilized mix was 375 degrees Fahrenheit. This temperature was selected after consultation with 3-M Company personnel and a field change was implemented to revise the Special Provision covering this item.

The only difficulty encountered during the construction operations was the pneumatic rolling phase. The asphalt concrete mix temperature was approximately 290 degrees Fahrenheit while the asphalt concrete stabilized mix was approximately 375 degrees Fahrenheit. This necessitated a delay in rolling the stabilized areas to prevent "picking-up" on the tires of the roller.

All of the major intersections and their approaches were stabilized with the exception of Fillmore Street, which will be used for control purposes.

The air temperature varied from the 70's to the high 90's during construction operations.

Traffic was carried through the new construction except during actual construction operations. The heavy cross-street traffic caused some problems but this was unavoidable and seemed to cause no damage. The average daily traffic count was 14,400 on the west end of the project, 22,000 in the middle of the project and 15,400 on the east end of the project.

The appendix contains photographs of Grand Street and Fillmore Street intersections after construction. These can be used for references in follow-up reports.

4

## EVALUATION

The purpose of this experimental project was primarily to evaluate performance of an asphalt concrete stabilizing additive in increasing the asphalt's resistance to shoving, rutting, and movement under heavy traffic and to restore structural integrity to the pavement.

The performance of the roadway will be watched regularly by the Maintenance Foreman and any unusual changes will be called to the attention of the District Engineer.

The cost per square yard for the stabilized asphalt concrete pavement was \$3.90 with the stabilizing additive being \$1.57 or 40 percent of the total cost.

## SUMMAR Y

The evaluation of the performance of the stabilized asphalt concrete pavement is initiated with this report. To this date, October 1982, no shoving, rutting or movement has been observed and there are no failures in the pavement structure.
