I. INTRODUCTION

A comprehensive study of freeway operation, design and control was initiated in 1963 on a six-mile section of the Gulf Freeway in Houston. The project was organized into three major study phases: Operations, Design, and Systems Analysis. The study of interchange traffic was assigned to the Design Phase of the Project. This phase has as one of its objectives the development of the travel characteristics, on the city streets as well as on the freeway, of the traffic that interchanges with the freeway.

Scope of the Study

The scope of this study is to provide information that will reliably describe the travel patterns of the interchange traffic* of the Gulf Freeway during periods of peak traffic. A complete survey of this traffic will be accomplished by the use of origin-destination surveys of ramp traffic, volume counts on the freeway, frontage roads and city streets and turning movement studies at major intersections. The work of the first year was concentrated on the morning peak traffic and the results of the studies presented in this report are for the eleven entrance ramps on the inbound side of the Gulf Freeway.

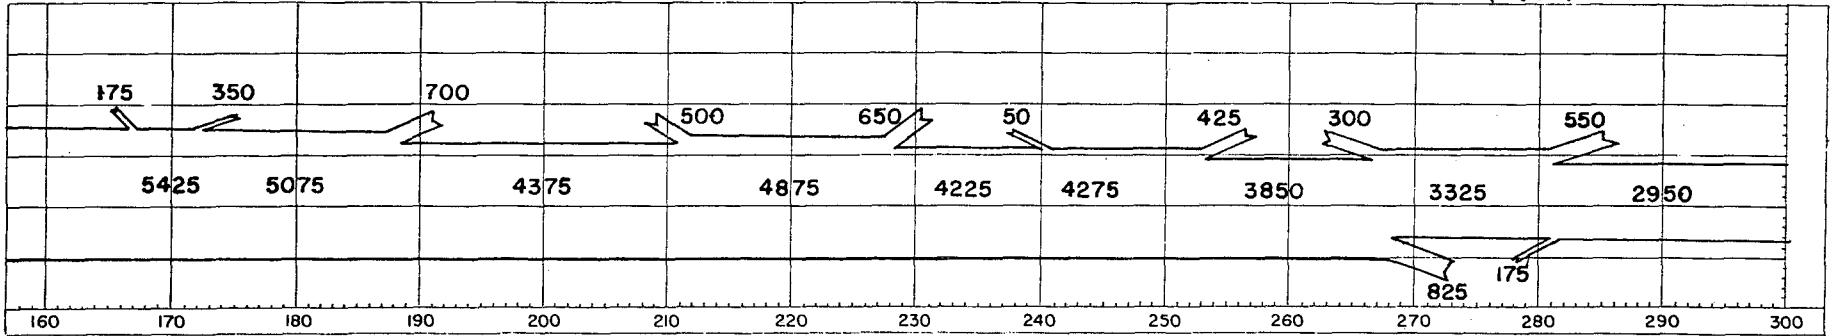

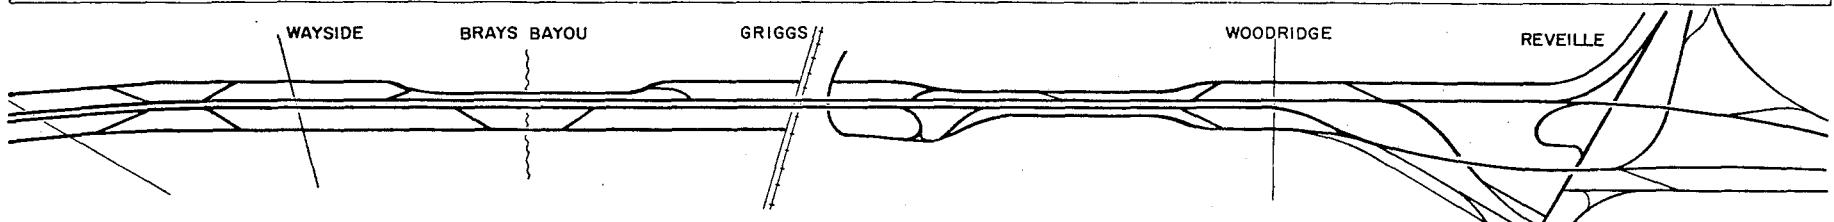

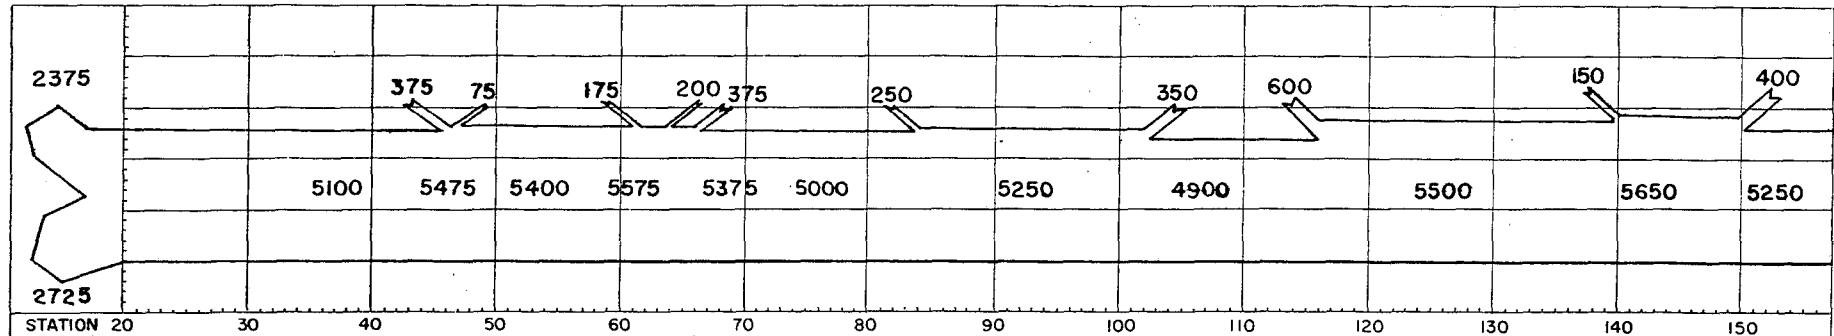

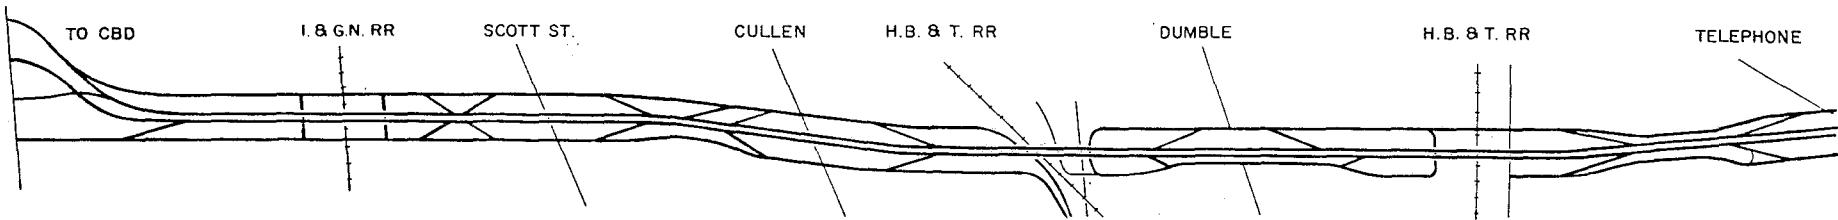

Analyses of the data are limited to detailed presentations of the information that illustrates as many travel characteristics as are necessary to describe the patterns of the interchange traffic. Some interpretations of the travel patterns are made in the report, but the major contribution of this work is the presentation of the data.

Objectives of the Study

The primary objective is to develop the travel patterns of the traffic that enters the Gulf Freeway from the Reveille Interchange to the Distribution System at Dowling Street. In particular, the study was designed to accomplish the following:

- (1) To establish the "travel corridor" limits, or zone of influence of the Gulf Freeway.
- (2) To determine the trip lengths of the traffic entering the freeway in the study area.
- (3) To determine the routes used on the city street system to approach the Gulf Freeway.

* Interchange Traffic refers to that traffic that enters the freeway by way of one of the eleven entrance ramps in the study area.

- (4) To determine the origins and destinations of the motorists who enter the freeway by one of the entrance ramps in the study area.

II. STUDY PROCEDURES

Study Locations

The Gulf Freeway experiences severe congestion every weekday morning from the Reveille Interchange to Wayside Interchange. Figure 1 illustrates the typical traffic volumes from 7:00 to 8:00 A.M. Also on this sketch are eleven entrance ramps that were studied. These ramps were studied in four groups:

Group 1: State Highway 35 - The first ramp selected for a study was the left hand entrance ramp at State Highway 35. The traffic using this ramp did not have a convenient alternate route to bypass the survey station so that almost 100 percent usage was experienced during the study. Although the ramp volume was high, there was adequate storage room for vehicles delayed at the survey station. This ramp presented the best conditions for developing the study technique with minimum disruption to traffic.

Group 2: State Highway 225, Woodridge Ramp, Mossrose Ramp - The second survey was conducted two months later on the next three ramps in the freeway system. These three were grouped together so that traffic bypassing one of the ramps would eventually enter the freeway at one of the study ramps, because of the discontinuous frontage road at Griggs Road.

Group 3: Griggs Ramp, Wayside Ramp, Telephone Road, Dumble Ramp - The third survey was conducted two months later on the next four ramps downstream. Again, the discontinuous frontage road at the Dumble Area Prevented traffic from bypassing the study ramps to enter the freeway.

Group 4: Cullen South Ramp, Cullen North Ramp, Scott Ramp - One month later the fourth survey was conducted on the remaining three ramps. A large number of vehicles bypassed the study area and continued to the business district on the frontage road. No attempt was made to encourage this traffic to enter the freeway at one of the study ramps.

Data Collection Procedure

All study techniques designed to give information on the origin and destination of motor vehicle trips were considered for use in this survey. Two limitations placed on the study were that disruption of the traffic had to be at a minimum when working with freeway traffic and the survey was concerned with that specific group of motorists that entered the freeway in the study area from one of the eleven ramps during the morning peak.

The "lights on" technique^{1*} was considered because it can be applied to a specific segment of traffic, such as entrance ramp traffic. This procedure instructs all motorists in the traffic stream to be studied to turn on their headlights. Observers stationed at various locations record the vehicles' positions. This technique was rejected because the data were limited only to the travel patterns of the interchange traffic on the freeway lanes.

The roadside interview technique was rejected because of the delay and inconvenience to the motorists and the possible distraction to the freeway traffic. Home or business interviews would require a very large sample to obtain sufficient data from the particular segment of the freeway traffic that is being studied.

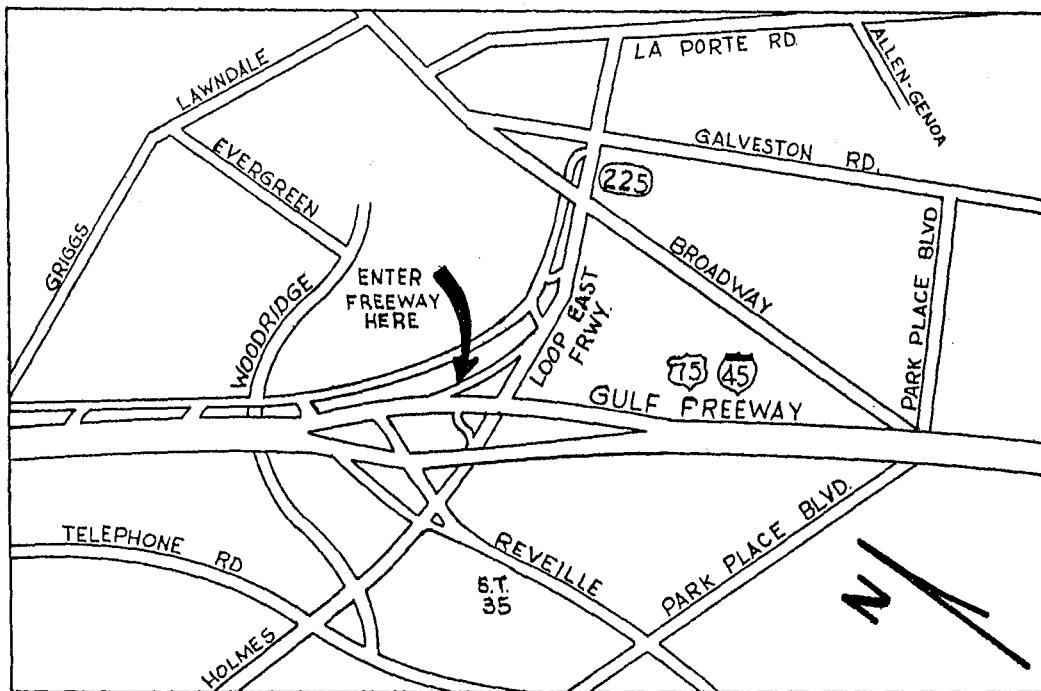

A technique which combines the use of field observations and mailed questionnaires was developed for use in a Los Angeles Freeway study² and later adapted for use in a study in Chicago.³ This procedure requires that the license plate numbers of all vehicles using the ramp during the study period be recorded. The names and addresses of the vehicle owners are then obtained from Motor Vehicle Registration records and questionnaires with return postage guaranteed envelopes enclosed are mailed to these persons. Since favorable returns were received in the studies in Los Angeles and Chicago, the same type of questionnaire form and data return by mail procedure were selected for this study.

However, the method of distribution of the questionnaires was changed. Each motorist entering the ramp during the study period was stopped and issued a questionnaire, return postage guaranteed envelope, and a letter of explanation (Figures 2, 3, & 4). The forms were issued at a rate faster than the vehicles could merge into the freeway so that the motorists did not experience any additional delay (Figure 5). This procedure has several advantages:

1. 100 percent distribution is assured.
2. Motorists may fill out the form immediately after the trip in question.
3. Office work in preparing the forms for distribution is reduced.
4. Forms are received by the driver of the vehicle making the trip and not by the owner of the vehicle.
5. Recording and addressing errors are eliminated.
6. Time of arrival for each vehicle can be determined accurately.

* Numbers refer to references listed at the end of the paper.

QUESTIONNAIRE

The following questions concern the trip being made at the time you receive this questionnaire.

1. Please draw a line directly on the above street map showing the route you followed in reaching the indicated entrance ramp. If the origin of the trip is not included in the area shown, extend the route to the border of the map.

2. Where did this trip begin?

Street Address	City	Time of Day
----------------	------	-------------

3. Where did this trip end?

Street Address	City	Time of Day
----------------	------	-------------

4. What exit ramp did you use to leave the freeway? (Check One)

<input type="checkbox"/> Exit No. 7-Wayside	<input type="checkbox"/> Exit No. 4-Calhoun-Elgin	<input type="checkbox"/> Exit No. 1-Sampson
<input type="checkbox"/> Exit No. 6-Telephone	<input type="checkbox"/> Exit No. 3-Cullen	<input type="checkbox"/> Pease Street
<input type="checkbox"/> Exit No. 5-Lombardy	<input type="checkbox"/> Exit No. 2-Scott	<input type="checkbox"/> US 75 North-Calhoun St.

5. How often is this trip made between 6:30 and 8:30 a.m. (Check One)

<input type="checkbox"/> Seldom	<input type="checkbox"/> Twice per week	<input type="checkbox"/> Four times per week
<input type="checkbox"/> Once per week	<input type="checkbox"/> Three times per week	<input type="checkbox"/> Five or more times per week

6. Do you ever use other routes to make this trip? yes no.

If yes, what major streets are used? _____

After you have completed this questionnaire, please mail it back to us in the addressed envelope at your earliest convenience to the Texas Highway Department, Research Project, P. O. Box 26656, Houston, Texas 77032.

THANK YOU FOR YOUR COOPERATION

IN REPLY REFER TO
FILE NO.

Dear Motorist:

We need your help in a Special Traffic Study of the Gulf Freeway which is being conducted in cooperation with the Texas Transportation Institute. This study has the objective of providing safer and more efficient operation on the Gulf Freeway. In order to develop better traffic operation on freeways, it is necessary to learn how the individual motorist uses them.

You are not required to sign any form and the information provided by you will be kept confidential. We would appreciate your completing the attached questionnaire as accurately as possible and returning it to our office.

Your participation and cooperation in this survey will be greatly appreciated.

DISTRIBUTION OF ORIGIN AND
DESTINATION FORMS TO FREEWAY
RAMP TRAFFIC

FIGURE 5

Data Reduction Procedure

As the returns were received through the mails, the forms were coded according to the items listed in Appendix A. The origins and destinations were assigned zones according to the official coding index of the City of Houston⁴, and the Origin-Destination Survey of Houston⁵ Metropolitan Area conducted by the Planning Survey Division of the Texas Highway Department. Other information was zoned in a convenient order for tabulation.

The data were put on IBM punch cards and the various tabulations required to categorize the information were made.

III. RESULTS OF STUDIES

The response to the surveys was very favorable (Table 1). The overall return was approximately 57 percent and the response from some of the critical ramps such as SH 35, Mossrose, and Griggs Road was higher. The validity of the results is further substantiated by the fact that more than 90 percent of the returns indicated that this trip was made 5 or more times during the week.

TABLE 1

Schedule of

ORIGIN-DESTINATION STUDIES

<u>Date</u>	<u>Ramp</u>	<u>Number of Questionnaires Distributed</u>	<u>Number of Questionnaires Returned</u>	<u>Percent of Total Distributed</u>
Nov. 21, 1963	S.H. 35	1200	783	65.3
Jan. 23, 1964	S.H. 225	718	419	58.4
	Woodridge	609	395	65.0
	Mossrose	750	493	65.8
Mar. 12, 1964	Griggs Road	1000	596	59.6
	Wayside	539	248	46.0
	Telephone Rd.	598	288	48.1
	Dumble	559	226	40.4
Apr. 10, 1964	Cullen South	470	247	52.6
	Cullen North	299	148	49.5
	Scott	149	59	39.6
	Total	6891	3902	56.7

In the following sections the information has been analyzed and tabulated for each individual ramp and then combined to present the combined effect of interchange traffic on the freeway and city street system.

Traffic Assignment

Questionnaires were distributed at each of the eleven ramps from approximately 6:45 to 8:30 A.M. The number of vehicles entering the freeway during this period at each ramp is shown in Figure 6. Other numbers shown on the frontage roads and city street system are indications of how the ramp traffic is distributed over the approach routes. These are combined volumes with all eleven ramps represented on the one drawing. Figures 7 through 17 show the same information for individual ramps.

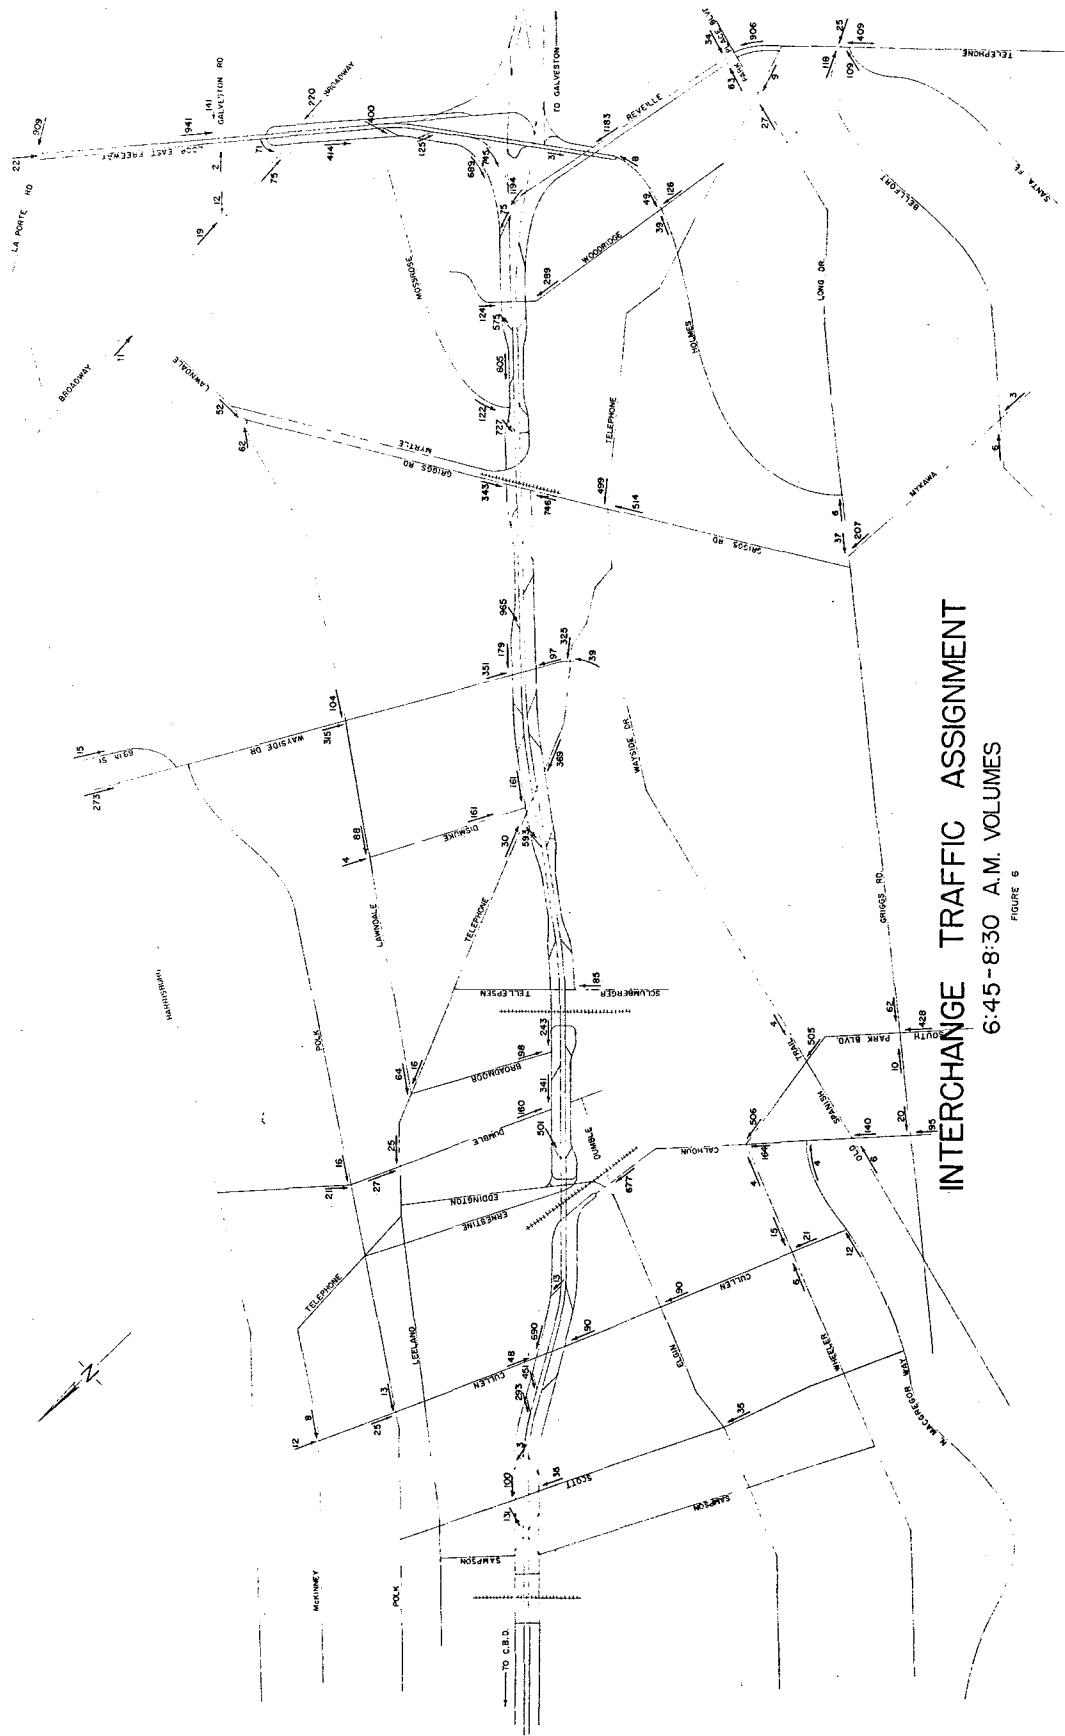

The volumes at the intersections near the freeway are very accurate because the freeway system is limited to a few access streets and because sketches included on the questionnaires provide some information on approach routing. The volumes shown at some distance (over one mile) from the freeway are assigned to the street system according to the location of the trip origins. These are somewhat in error due to the omission of minor streets that are used as feeders to the major street system.

This information is important in the study of traffic reassignment, which is necessary when ramps are to be controlled, or signal timing systems are to be altered. These figures can be broken down into any time intervals so that the control period volumes can be studied separately.

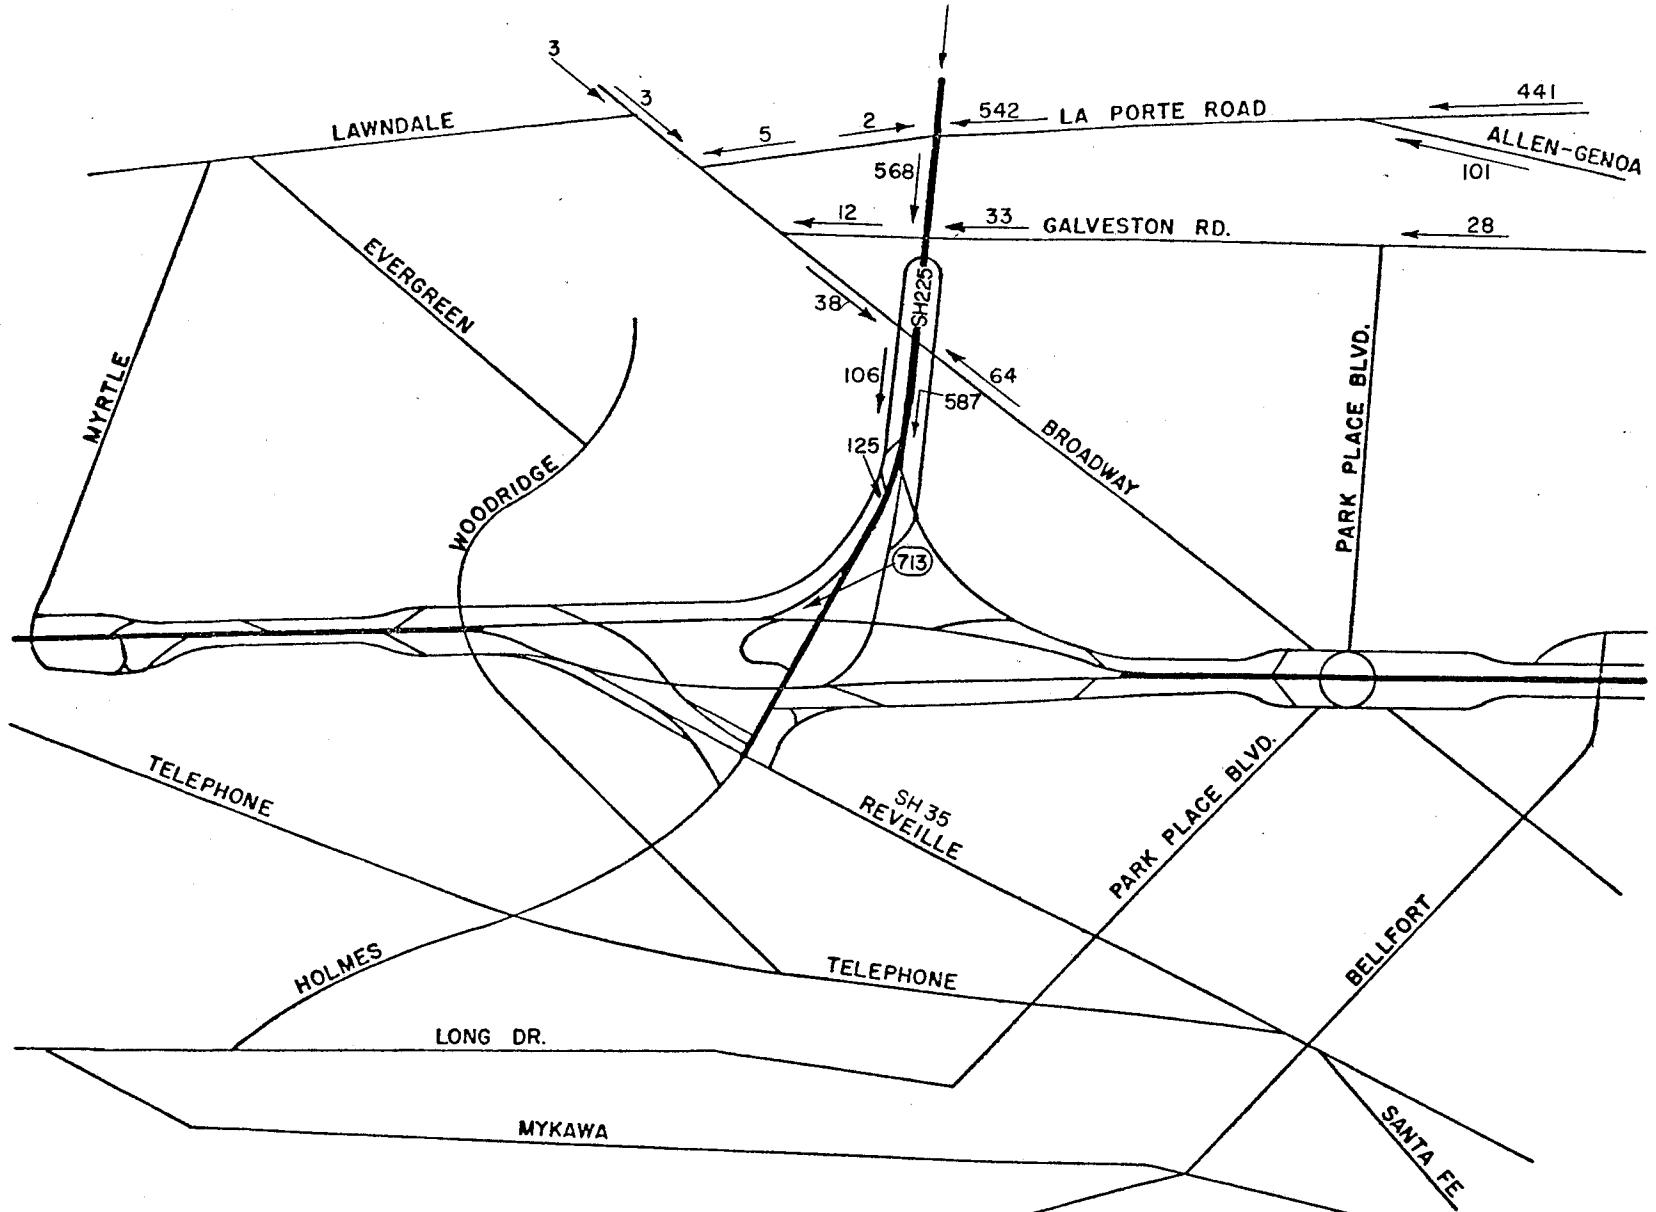

Summary Tables

Tables 2 through 12 present some of the data from the returns for the individual ramps. The data on the present return, the exit ramp used, frequency of use, and the use of alternate routes are presented in 15-minute time periods. Totals, shown for the forms returned, are expanded for the total number distributed. In every case this expansion is based on the percent return only. The totals for each time interval can be expanded based on the rate of return of the forms distributed during that period. This rate seems to vary according to the degree of difficulty experienced by the motorists. The more serious the problem, the higher the response rate.

The distance in miles between the entrance ramp and every downstream exit ramp is included on the form. With these freeway trip lengths and the number of vehicles using each exit ramp, the distribution and average of the freeway trips for each ramp can be obtained.

Freeway Trip Lengths

The trip lengths of traffic entering the study section from the entrance ramps were determined from the ramp spacing. The fact that the study area was in the last five miles of the freeway which ends at the distribution system to the downtown street system accounted for the large percentages of traffic destined for the end of the freeway. The number of vehicles destined for each of the ramps is listed in Tables 2 through 12. A summary of the average trip lengths compared to the maximum trip lengths is shown in Table 13. The only unusual feature of this table is the apparent reversal of the trend in average trip length at the Griggs Road. This reversal is due to the large decrease in Average Trip Length at the Mossrose Ramp. Table 5 indicates a high volume of traffic entering at Mossrose and exiting at Wayside, a total freeway trip of 0.32 miles. The reason for this short freeway trip is the discontinuous frontage road at Griggs Road. Although in absolute numbers the short trips on the freeway are small, their effect on the freeway operations is magnified during periods of heavy traffic congestion. It is apparent that some attempt should be made to eliminate these trips from the freeway lanes.

Freeway Area of Influence

To define the area of influence the Gulf Freeway has on the travel patterns in the Houston Area, the desire lines for all trips using the freeway during the morning peak were plotted (Figures 18 and 19). More than 90 percent of all origins fell within one mile on either side of the freeway. A tabulation of the trips from zone of origin to zone of destination is presented in Appendix B. These zonal interchanges represent the 65.7 percent return received for the entire study.

Trip Desire Lines

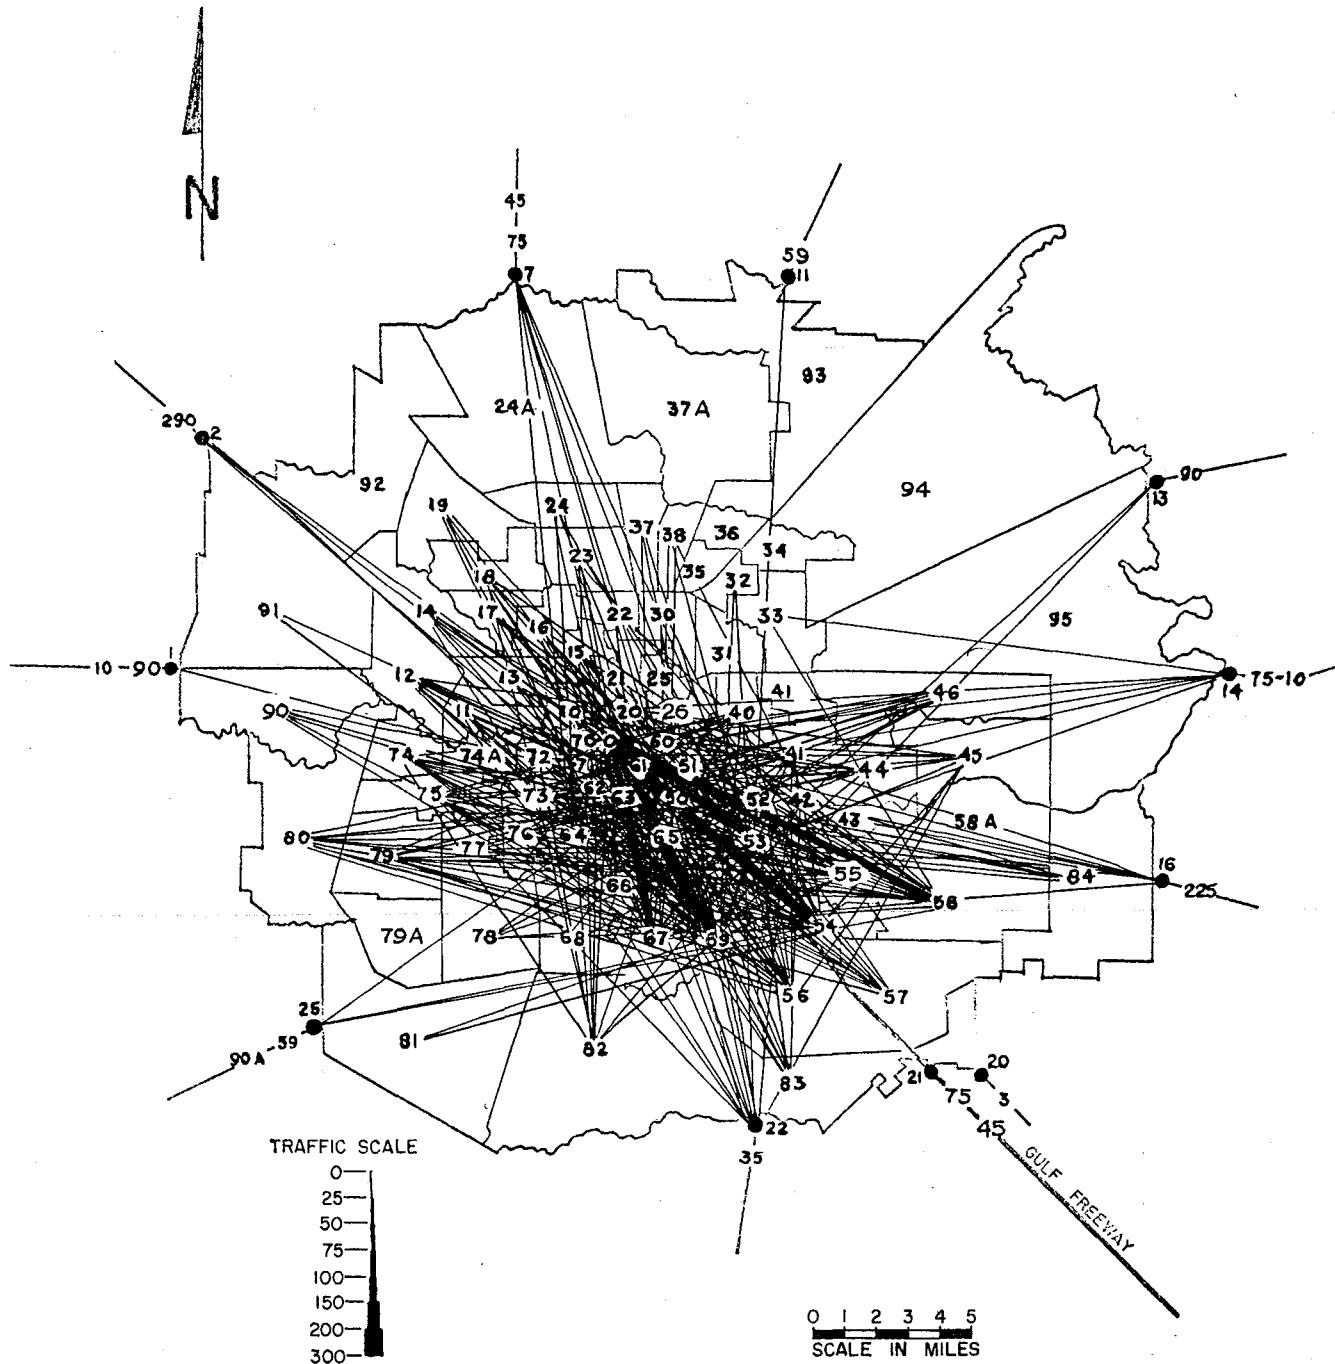

The areas of influence for the individual entrance ramps are indicated on the drawings of the origin-destination desire lines with the freeway link included (Figures 20-30). These drawings indicate how far from the freeway diversion may be effective if entrance ramps are to be controlled. These presentations also illustrate the distribution of freeway trip lengths from each of the entrance ramps. The desire lines point out the possible diversion of some traffic to more suitable travel routes on the surface street system.

The areas of influence for individual exit ramps are shown in the drawings of the exit ramp-destination desire lines. (Figures 31-40). Since the origins of these trips were represented in the preceding section, they were not replotted on these drawings.

FIGURE 40

Diversion of Ramp Traffic

In each of the four origin-destination surveys, some traffic diversion was noted. Although some of the diversion was caused by the study itself, most of the drivers were seeking a better way to complete their trip. The following statements concerning the diversion are based on comments received by the motorists and on daily observations of the traffic patterns at these ramps: Figure 6 is used to reference the routes used to bypass the ramps.

State 35 Entrance Ramp - The lack of a convenient bypass route for this ramp reduces the amount of diversion. It was noted, however, that if the queue at the ramp were sufficiently long to extend past the Holmes Road Overpass, the approaching traffic would divert through an adjacent Shopping Center Parking Lot to Woodridge. During the day of the survey, approximately ten percent of the total ramp volume of 1350 vehicles per two hours used this alternate route.

State 225, Woodridge and Mossrose Entrance Ramps - It has been observed that as the congestion develops on the freeway in the Reveille Interchange, traffic approaching from the east on State 225 diverts to the frontage road and continues to the entrance ramps downstream at Woodridge and Mossrose. From the questionnaires returned, the following estimates of the volume of traffic bypassing these ramps from 6:45 to 8:30 A.M. can be made:

Ramp	Total Number Entering	Total Number Bypassing
State 225	718	670
Woodridge	609	412
Mossrose	750	---

Griggs, Wayside, Telephone and Dumble Entrance Ramps - The volume of traffic bypassing these ramps via the frontage road is very small. The intersections at Wayside and Telephone restrict the movement along the frontage road enough to discourage its use as a bypass route. Also, the operating characteristics of the freeway and ramps at these locations are good during the entire peak period. There is some diversion evident in the selection of routes to approach the freeway. It is felt that the conditions on the street system have more effect on the selection of routes than the entrance ramp to be used. A breakdown of the traffic volumes that bypass upstream ramps are listed below:

Ramp	Total Number Entering	Total Number Bypassing
Griggs	1000	87
Wayside	539	103
Telephone	599	67
Dumble	559	---

Cullen and Scott Entrance Ramps - A large volume of traffic bypasses these ramps because the continuous frontage roads provide an acceptable route to the end of the freeway. Very few vehicles passing these ramps use the downstream ramp to enter the freeway.

Alternate Routes

Question number 6 on the questionnaire is concerned with the use of alternate routes on the city street system to avoid the use of the freeway. The tabulations of the answers are given in Tables 2-12. Thirty-six percent of the interchange traffic have used other routes. This indicates that many motorists are willing to try, and perhaps continue to use, other routes if they result in improvements over the freeway trip.

The streets named as alternate routes are included on the map in Figure 6. This information was helpful in designating alternate routes to be used in ramp control studies.

Comments on Returns

The questionnaire form did not include a remarks section. However, many of the motorists offered comments that were pertinent to the freeway problem. These comments were in most cases constructive criticism of the design and control of the freeway. The statements indicated an awareness by the motoring public of the problems that are associated with a traffic facility of this type.

Although most of the comments were of a critical nature, many persons offered their time and services to answer any other questions. In general, the public was pleased to see that someone was interested in "their" problem.

A few of the more important remarks received are listed below:

- * Need continuous frontage roads
- * Improve entrance ramp design
- * Close some entrance ramps
- * Keep trucks off freeway during peak traffic
- * Place screen in median to reduce distraction
- * Need for better and faster accident investigation

IV. CONCLUSIONS

The techniques used in this study for obtaining travel patterns of the interchange traffic provided good results with minimum interference to traffic. Only in locations where stopping the traffic is hazardous should the method of distribution be changed.

The design of the questionnaire should be improved. The definition of the trip for which the questions are asked should be included in the explanation. Several returns gave information on the trip made during the afternoon peak.

The high percent return indicated an acceptance by the public of this type of survey. This same study will be made next year of the entrance ramps on the outbound side of the freeway.

The information received from this type of survey has been most valuable in several phases of the research on the improvement of freeway operations.
